

EARLY IMPACTS OF THE ACA ON MINNESOTA'S UNINSURED

Key findings from a report published in the November 2015 issues of the **American Journal of Public Health**. Full report of study findings can be found [HERE](#).

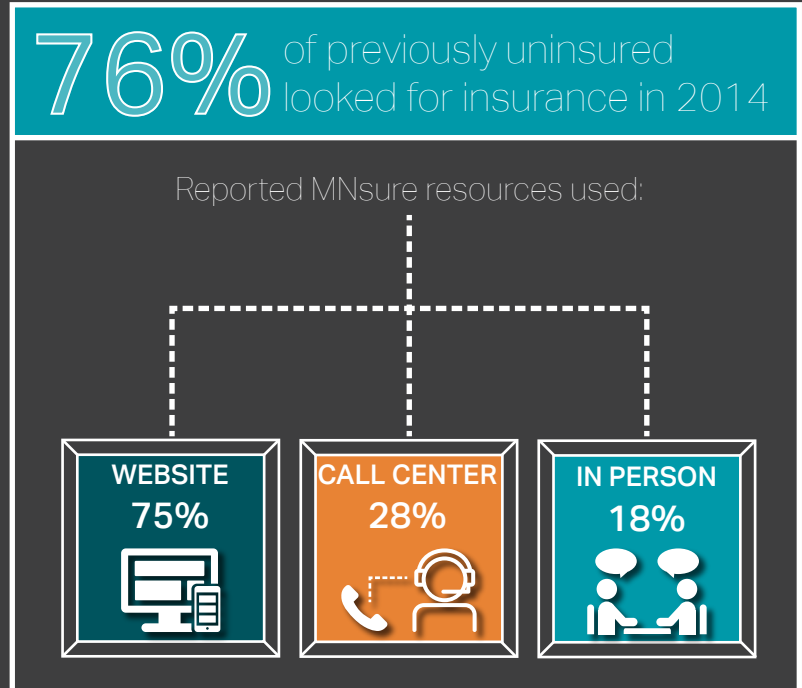

Uninsured who gained coverage were:

MORE THAN SEVEN times more likely to seek help from an in-person assister.

ALMOST TWICE as likely to have a credit card to facilitate the purchase of coverage.

MORE THAN THREE times as likely to feel well-protected when it comes to health care needs.

Findings are from the Minnesota Health Insurance Transition Study (MN-HITS), a joint effort by SHADAC at the University of Minnesota and the Minnesota Department of Health, Health Economics Program. MN-HITS is a longitudinal telephone survey focused on non-elderly (under 64) Minnesotans who reported being uninsured or covered through the non-group market in the Fall 2013 Minnesota Health Access Survey. The previously uninsured refers to individual who reported being uninsured in the fall of 2013. Study methodology can be found [HERE](#).
