Research Project to Understand the Medicaid Undercount: The University of Minnesota's State Health Access Center, the Centers for Medicare and Medicaid Services, the Department of Health and Human Services Assistant Secretary for Planning and Evaluation, The National Center for Health Statistics, and the U.S Census Bureau

---

Phase II Research Results:
Examining Discrepancies between the National Medicaid Statistical Information System (MSIS) and the Current Population Survey (CPS) Annual Social and Economic Supplement (ASEC)

Final
June 8, 2007

Note: This paper was made possible by grant 052084 from the Robert Wood Johnson Foundation to the State Health Access Data Assistance Center (Michael Davern, PI) with additional support supplied by the Office of the Assistant Secretary for Planning and Evaluation (ASPE), the Center's for Medicare and Medicare Services (CMS), and the U.S. Census Bureau. This paper has undergone a limited review by all the participating organizations in accordance to existing agreements among these organizations. The views expressed are those of the author(s) and not necessarily those of ASPE, CMS, or the US Census Bureau.

I. Introduction

This paper describes the results of the second phase of a four-phase research project of University of Minnesota's State Health Access Data Assistance Center (SHADAC), Centers for Medicare and Medicaid Services (CMS), Assistant Secretary for Planning and Evaluation (ASPE), National Center for Health Statistics (NCHS), and the US Census Bureau. The research is designed to explain why discrepancies exist between survey estimates of enrollment in Medicaid and the number of enrollees reported in state and national administrative data.

The research done for this project includes both national and state-level analysis. National files include the Medicaid Statistical Information System (MSIS), the Medicaid Analytic eXtract (MAX), and the Medicare Enrollment Database (EDB). Survey files include the Current Population Survey (CPS) and the National Health Inventory Survey (NHIS)[1]. Additionally, the following states have been invited to participate in this study: Florida, Maryland, California, Pennsylvania, New Jersey, Louisiana, and Minnesota. Participating states will provide data from their Medicaid and State Children's Health Insurance Program (SCHIP) enrollment files to CMS, and CMS will, in turn, provide these data to the U.S. Census Bureau.

Understanding differences between enrollment data and survey data will benefit the Census Bureau and other participating agencies by suggesting possible improvement to CPS and other surveys. It will also engender a better understanding of existing CPS insurance data that provide a more accurate view of Medicaid and other insurance coverage for U.S. residents. As such, this research will enable a revised computation of the number of U.S. residents without health insurance. We consider the results presented in this paper to form only a basis—a jumping-off point—for making such an analysis. Without a sophisticated strategy to reassign surveyed persons categorized by CPS as uninsured but established by this study to have Medicaid coverage that considers the effect of having non-randomly missing data and also the offsetting effect of false positive reporting, such a computation would likely be significantly inaccurate. We expect additional work released by team members to speak directly to this issue.

II. Objective and Scope

The objective of Phase II is to investigate the size and source of the discrepancy between estimates derived from the Current Population Survey (CPS) March Supplement (known also as the Annual Social and Economic Supplement or ASEC) and counts of enrollees derived from MSIS. The input for this research is the validated MSIS and MAX files for calendar year (CY) 2000 and 2001 matched respectively to the 2001 and 2002 Current Population Survey March Supplements (ASEC), and the Census Bureau's Master Address File Auxiliary Reference File (MAF-ARF) and Person Characteristics File (PCF). We also use MSIS enrollment data for the first four months subsequent to each survey's reference period (which is the calendar year immediately prior to the year of survey administration) because we conjecture that current and

[1] Description of these files can be found in Appendix III.

recent enrollment status (though not germane to the CPS questions about Medicaid coverage as worded) helps explain respondent reporting of Medicaid coverage.

To address explanations for discrepancies between CPS and enrollment reported in MSIS, we produced summary statistics intended to suggest or discredit plausible explanatory factors for it. We constructed a series of logistic models to evaluate these factors in a multivariate setting. Additionally, we provided a summary data file for team members to corroborate and extend our analysis. Phase II Metadata can be found in Appendix IV and detailed tables in Appendix V. The Appendix V tables appear each in two presentations: the first using the original CPS survey weights and the second using adjusted weights developed by a re-weighting process described in Appendix III, which also describes the research files and other methods used to produce the results.

III. Methodology and Questions Answered

File Processing to Create the Research File

1. Validate MSIS records using a modified version of the Census Bureau's Person Identification Validation System (PVS). The validation technique compares the date-of-birth and sex shown on the MSIS record to the date-of-birth and sex shown for that SSN on the Social Security Administration's Numident file. The process works under the assumption that if the MSIS SSN were incorrect, it would be highly unlikely for the MSIS and Numident date-of-birth and sex to be similar. For validated records, convert the SSN to an anonymous Protected Identity Key (PIK) to protect the security of the personal information.
2. Use the MAF-ARF, which contains PIKs and Master Address File Identifiers (MAFIDs, each representing a specific place of residence) to determine persons who may have been out of the CPS universe because they lived in institutional group-quarters.
3. For each person in MSIS, determine the months during which that person was enrolled in Medicaid and output a record showing this to the MSIS Summarized Enrollment History File (MSEHF), which has a single record for each validated SSN on MSIS and a single record for each MSIS client account without a validated SSN.
4. Process CPS records through the PVS, which includes verification and search procedures, to assign a PIK.
5. Account for the CPS cases that are un-linkable because the (represented person's) SSN is unknown or unverifiable. Create a new set of CPS weights by dropping these un-linkable cases and re-assigning their weight proportionally to records within the same re-weighting strata that **do** have identifying data. While the re-weighting strata are developed in a way meant to minimize bias in derived estimates, re-weighting would cause completely no bias only if person-identification data are missing-at-random[2]: that

[2] Little, R. J. A., Rubin D.B., Statistical Analysis with Missing Data. 2nd Edition.Wiley, 2002.

is to say, if the missing-ness of the identification data is statistically independent, within each re-weighting stratum, of any characteristic being measured. In the real world, this is unlikely to be true, and so, to the degree that the measured characteristics vary according to the missing-ness of the identity data, re-weighting could introduce bias into the generated estimates just as similar post-stratification adjustments made to all Census Bureau demographic households surveys can. Nevertheless, we believe that re-weighting is a way to project the results from the identified CPS reportees[3] to the entire CPS frame.

6. Process the MAX data for the analysis year by validating the SSN (by comparison to matching MSIS record) and replacing it with a PIK.
7. Link MSEHF to CPS, the Person Characteristics File (PCF), and the processed MAX file, joining on PIK. Produce tabulations shown in Tables 1 and 2 (Appendix IV). Produce an analysis file with a single record for each person in CPS. Use this analysis file to produce tabulations for Tables 3 and 4 (Appendix IV) and to perform the regression analysis.

Assessing the feasibility of using record linkage to identify survey errors causing the discrepancy between the CPS March Supplement and the national MSIS

Q1: What is the status of the raw match between CPS observations and MSIS records?

Prior to accounting for universe differences and duplicate records, how many CPS and MSIS records have person-identifying data (PIK substituting for SSN) so we can determine the record's type of match outcome and therefore use it in the analysis of the count estimate discrepancy? How does the analytical universe differ after we use adjusted weights to account for being unable to correctly determine type of match outcome for CPS records lacking identifying information?

We tally raw un-weighted and weighted counts of the number of CPS and MSIS records by type of match outcome. Counts are tallied overall and by selected characteristics. We use CPS demographic characteristics, poverty level, and health insurance coverage responses for CPS only and CPS-to-MSIS matched records. For MSIS only, we use PCF (or when PCF characteristics are unavailable, MSIS) demographic characteristics, and type of benefits. These tallies are presented in Appendix V, Table 1, which provides an overview of the match process.

[3] In this document, "reportee" refers to all household members of reporting households; "respondent" refers only to the household members (one for each household) that took part in the survey interviews.

Assessing the scope of the survey undercount

Q2: What is the size of the discrepancy between CPS and MSIS?

How does the CPS estimate of enrollees compare to the MSIS count of enrollees? How does it compare after making adjustments to account for universe differences? What is the distribution of the discrepancy between MSIS counts and CPS estimates by demographic category? How does this distribution vary among residents of different states?

We make the raw MSIS count of Medicaid enrollees by totaling the number of client accounts excluding persons known to be deceased prior to March of the corresponding survey year, and we make the CPS estimate by weighting each member of the households in CPS by the final survey weight and summing.

However, before comparing the MSIS count to the CPS estimate, we account for the differences in what each measure covers. Direct comparability is inappropriate for several reasons:

- Differences in the definition of enrollment
  - The raw MSIS count includes individuals in the State Children's Health Insurance Program (SCHIP) if it is run through Medicaid (an arrangement called "Medicaid-expansion SCHIP") and it only sometimes does include individuals in SCHIP in run separately from Medicaid (an arrangement called "stand-alone SCHIP"). States may offer one or both of these types of plans.
  - In contrast, the CPS estimate made from the variable MCAID[4] does always include individuals who are reported to have SCHIP coverage, regardless of their state of residence and type of SCHIP program. Our preferred measure of Medicaid coverage, (which is an augmented version of the CPS variable CAID[5] (called subsequently Augmented-CAID[6])) does not count Medicaid persons identified covered through SCHIP but not explicitly identified as enrolled in Medicaid[7].

[4] MCAID is set to show Medicaid coverage for a reportee if the respondent indicates (for the reportee) coverage on Medicaid or SCHIP when first asked (in response to direct questions about each possible type of coverage), indicates Medicaid, SCHIP, Other Public Coverage, or Other Coverage in response to being asked about additional coverage (subsequent to answering initial questions about each type), or indicates Medicaid, SCHIP, or Other Public Coverage in response to a verification question asked about each household member who had not been reported (earlier in the health insurance question sequence) having any coverage. The Census Bureau uses MCAID in computing published CPS estimates of prior year Medicaid enrollees.

[5] CAID is set to show Medicaid coverage for a reportee if respondent indicates coverage on Medicaid in response to several direct questions (prior to being asked about any other coverage or verification of non-coverage) about Medicaid enrollment: whether any household members had Medicaid coverage, and if so, who in household had it.

[6] Augmented-CAID includes all reportees CAID shows enrolled and, in addition, reportees indicated with Medicaid coverage in response to questions asked about additional coverage or in response to a verification question asked about each household member who had not been reported having any coverage.

[7] Many times SCHIP and Medicaid share the exact same program name (e.g., Hoosier Healthwise in Indiana) and as a result are inseparable in the self-reported health insurance data.

- The raw MSIS count includes individuals receiving partial benefits (i.e., coverage only for selected services). In contrast, it is unclear if some respondents in the survey understand "coverage" as meaning *having received at least some medical care provided by Medicaid.* See Appendix II for details on how we decided to define coverage.

- Differences in the definition of universe
  - The raw MSIS count includes residents of institutional group quarters. In contrast, the CPS estimates do not account for them because they are not part of the CPS sampling universe.

- Differences in the definition of the unit of measure
  - The raw MSIS count is a measure of the total number of Medicaid client accounts and so individuals who have multiple client accounts (sometimes within the same state and sometimes in multiple states) are counted more than once. In contrast, the CPS estimates are a measure of the total number of individual enrollees.

For these reasons we adjusted the raw MSIS count to make the measures more comparable. Appendix V, Table 2 shows a progression of adjusted MSIS counts, working from the one least comparable to the one most comparable to CPS estimates. Each subsequent column represents an exclusion being made to work towards a universe more directly comparable and the exclusions are cumulative:

- "MSIS Total A" excludes only *persons known dead prior to March of the survey year* (For MSIS 2000-CPS/ASEC 2001, 853,226 dead persons were excluded; for MSIS 2001-CPS/ASEC-2002, 905,525 dead persons were excluded) from the raw counts of client accounts.
- With "MSIS Total B" SCHIP clients are excluded from the counts.
- With "MSIS Total C" partial benefit clients are excluded from the counts.
- With "MSIS Total D" clients likely to reside in institutional group quarters are excluded from the counts.

  Our methodology to exclude persons in group quarters reviews other administrative data files and excludes individuals at addresses we know to be of institutions. This methodology has several known shortcomings:

  1. We cannot determine the identity (PIK substituting for SSN) of about 10% of enrollees shown on MSIS and therefore cannot look for institutional addresses for these persons.
  2. Many persons (31.2% for 2000 and 29.2% for 2001) who are identified (by PIK) nevertheless cannot be located in our alternative administrative data.
  3. Many residents of institutions are recorded in administrative records at previous addresses or at addresses of persons responsible for their affairs.
  4. We cannot identify all institutional addresses as such.

Because of these shortcomings, we believe this exclusion is of limited efficacy in identifying residents of institutional group quarters. Our intention is to more thoroughly attempt to account for these persons in our Phase III analysis.

- With "MSIS Total E" duplicative client accounts are excluded, and this count is of unique individuals as best as we can determine[8].

We believe that "MSIS Total E" is the most similar to the estimate of Medicaid enrollees coming from CPS. Nonetheless, we did make a final exclusion: with "MSIS Total F" we exclude cases with missing person-identifying information to simplify reckoning of the source of discrepancy.

CPS data offer several different ways to compute estimates of Medicaid coverage, depending on the data users' needs. We consider the discrepancy with MSIS in terms of three CPS estimates[9]:

- The first estimate [shown in Table 2 as "CPS Total A"] is a weighted tally of the MCAID variable. This is the variable that Census uses to generate Medicaid enrollee estimates. It is derived from a re-coding of several health insurance questions and categorizes persons identified as enrolled in Medicaid, SCHIP, other public coverage, and in some cases, simply "Other Coverage" as Medicaid enrollees. The estimate from MCAID can be considered a ceiling estimate for the number of Medicaid enrollees.
- The second estimate [shown in Table 2 as "CPS Total B"] is a weighted tally of the Augmented-CAID[10] variable. Augmented-CAID is set to show Medicaid coverage whenever a reportee is explicitly described as having had Medicaid coverage or can be expected to have been so described if the respondent properly completed the health

[8] Dual state reportees are counted only once and are not assigned a state for the state-level tallies.

[9] It should be noted that, in some instances, respondents reported as "*Medicaid enrolled in the reference year*" children born subsequent to the reference year but prior to the survey interview. Certainly, these children could not have actually been enrolled in Medicaid during the reference year since they were not yet born, and therefore these are false positive reports. The original-weighted tally of these children is as follows:

Survey Year	Reference Year	CPS Column A	CPS Column B	CPS Column C
2001	2000	172,972	161,324	44,687
2002	2001	165,376	152,680	54,686

[10] One significant difference between the Augmented-CAID variable (tallied in CPS Column B) and the MCAID variable (tallied in CPS Column A) is that MCAID variable is set (indicating Medicaid coverage) through the CPS coding procedure when a respondent indicates a child is enrolled in a State Children's Health Insurance Program (SCHIP), whereas this is not the case for the Augmented-CAID variable. In fact, some SCHIP programs, called Medicaid-expansion SCHIPs, are part of Medicaid, but others, called stand-alone SCHIPs, are not. Sometimes the CPS questionnaire fills are the exact same for SCHIP and Medicaid programs and sometimes not. Not all stand-alone SCHIP programs have a separate fill and not all Medicaid-expansion SCHIP programs share the same program name. Some states have one or the other of these types of programs, but some also have both, so not only is it quite likely that some respondents are uncertain about the Medicaid status of their children enrolled in these programs, but it is not straight-forward for analysts to determine if a CPS response indicating coverage in SCHIP should be identified as indicating Medicaid coverage as well. This is a limitation of our analysis, and should be considered when reviewing the tabulations in this report, particularly for persons under 18 years of age. It also suggests that neither MCAID (and Table 2, CPS Column A) nor Augmented-CAID (and Table 2, CPS Column B) can be assumed to be better aligned conceptually with actual coverage in Medicaid, and likely there is some type of in-between classification and corresponding estimate that would be better.

insurance question battery (in this case the response is said to be edited or imputed). The estimate from Augmented-CAID can be considered a floor estimate for the number of Medicaid enrollees.

- The third estimate [shown in Table 2 as "CPS Total C"] is a weighted tally of Augmented-CAID but only for explicit responses. Persons with Augmented-CAID set from an edit or imputation are specifically excluded from this tally so the tally should not be considered a valid estimate of the number of Medicaid enrollees. Instead it should be used to evaluate the degree to which the values under "CPS Total B" are derived from explicit reporting.

Assessing the cause of the count-estimate discrepancy

Q3: How did CPS respondents report health insurance status for individuals who are known Medicaid enrollees?

For individuals shown in MSIS to have had Medicaid coverage, how do their CPS Medicaid reports differ overall and categorically by various demographic characteristics, Medicaid enrollment patterns, other program participation, medical service utilization, and relationship to reference person[11]? How do these vary among enrollees whose Medicaid enrollment status was reported, edited, or imputed, and between enrollees with full benefits or any benefits?

From linked MSIS/CPS/MAX records, we generate Table 3 (Appendix V). Table 3 is presented in eight versions to show how reporting varies by source of health insurance data (reporting, imputation, or editing) and weighting schemes (using original weights or modified weights developed from the re-weighting process):

Table 3 Version:	**Table 3 Page #**
Enrollees with Full Benefits:	
A. Full Benefit Enrollees	1 - 3
B. Full Benefit Enrollees Whose CPS Insurance Status Was Edited	4 - 6
C. Full Benefit Enrollees Whose CPS Insurance Status Was Imputed	7 - 9
D. Full Benefit Enrollees Whose CPS Insurance Status Was Reported	10 - 12
Enrollees with Any Benefits:	
E. All Enrollees	13 - 15
F. All Enrollees Whose CPS Insurance Status Was Edited	16 - 18
G. All Enrollees Whose CPS Insurance Status Was Imputed	19 - 21
H. All Enrollees Whose CPS Insurance Status Was Reported	22 - 24

[11] The reference person is the first person identified by the respondent as having their name on the title or lease of the residence.

Q4: How did CPS respondents report health insurance status for individuals who are not known Medicaid enrollees?

For CPS reportees not known to be Medicaid enrollees (primarily if no matching MSIS record is found, but also if MSIS record found shows no Medicaid enrollment—for example, if the represented person is enrolled only under a stand-alone SCHIP), how does Medicaid enrollment reporting differ overall and categorically by various demographic factors, other program participation, and relationship to the reference person? How do these vary among reportees whose Medicaid enrollment status is reported, edited, or imputed and between matchable reportees (those with known SSN) and unmatchable reportees (those without known SSN)?

From CPS records unmatched to MSIS or matched to MSIS but not showing enrollment, we generate Table 4 in Appendix V. For the original weight presentation, we present Table 4 in eight versions. For the re-weighted presentation, since unmatchable reportees are assigned a zero weight, the versions for unmatchable reportees are suppressed because otherwise they would be filled with zeros. The remaining versions are identified identically to those in original weight presentation, but page numbering is altered.

Table 4 Version:	Orig. Wgt. Presentation Page #	Re-weighted Presentation Page #
Unmatchable Reportees:		
A. All Unmatchable Reportees	1 – 2	N/A
B. Whose CPS Insurance Status Was Edited	3 – 4	N/A
C. Whose CPS Insurance Status Was Imputed	5 – 6	N/A
D. CPS Insurance Status Was Reported	7 – 8	N/A
Matchable CPS Reportees not Known Receiving Medicaid:		
E. All Reportees Not Known Receiving Medicaid	9 – 10	1 – 2
F. Whose CPS Insurance Status Was Edited	11 – 12	3 – 4
G. Whose CPS Insurance Status Was Imputed	13 – 14	5 – 6
H. Whose CPS Insurance Status Was Reported	15 – 16	7 – 8

Q5: What does multivariate modeling tell us about the relative strength of factors related to the odds of a discrepancy between CPS and MSIS?

What factors affect the odds a known enrollee is misreported as not having Medicaid coverage? What factors affect the odds a known non-enrollee is misreported as having Medicaid coverage? What factors affect the odds a known enrollee is misreported as having been uninsured? What factors affect the odds a person reported as not having coverage was found to be an enrollee? What factors affect the odds a person reported as having coverage was found to be an enrollee?

We specified a series of logistic regressions to model the odds of response error in reporting about Medicaid coverage in the CPS and to impute actual Medicaid enrollment status from CPS data:

Model 1a (n=38,388)
Modeling Reported Not on Medicaid for Known Full Benefit Enrollees

Model 1a is a behavioral model of the event that the CPS respondent explicitly reported no Medicaid coverage (Augmented-CAID is not set) for an enrollee. The universe is CPS reportee whose insurance status was explicitly reported (i.e., not imputed or edited) and for whom MSIS shows received full Medicaid benefits during the survey reference period.

Model 1b (n=265,839)
Modeling Reported on Medicaid for Reportees Whose Enrollment Count Not Be Confirmed in MSIS

Model 1b is a behavioral model of the event that the CPS respondent explicitly reported Medicaid coverage (Augmented-CAID is set) for a non-enrollee. The universe is CPS reportees with an explicit survey report about Medicaid and a PIK but no matching record found in MSIS. While this model is intended to explain the occurrence of false positive

Medicaid reporting, it is important to note, that false positive reporting is only one reason why we could not confirm enrollment for these persons; this universe also includes persons whom we could not confirm enrolled because the MSIS records showing their enrollment are un-linkable (i.e., the SSN on those records were missing, wrong, or unverifiable). It is also possible that these persons had some other government sponsored health insurance coverage, such as from a stand-alone SCHIP, which are not actually part of the Medicaid program, but work in a similar way. For this reason, results from this model are more suggestive than conclusive about factors related to false positive reporting.

Model 2 (n=38,388)

Modeling Reported Not Insured for Known Full Benefit Enrollees

Model 2 is a behavioral model of the event that the CPS respondent explicitly reported no insurance coverage (Medicaid or other types) for an enrollee. The universe is CPS reportees whose insurance status was explicitly reported (i.e., not imputed or edited) and for whom MSIS shows received full Medicaid benefits during the survey reference period. This model is identical in set-up to Model 1a, except the dependent variable is *reported with no insurance rather that reported with no Medicaid coverage.*

Model 3a (n=311,308)

Modeling Enrolled with Full Benefits for Persons Reported Not Enrolled

Model 3a is an imputational model of the event that persons with no CPS indication (explicit, edited or imputed) of Medicaid coverage are found in MSIS to have received full Medicaid benefits. The universe is CPS reportees with Augmented-CAID not set.

Model 3b (n=35,241)

Modeling Enrolled with Full Benefits for Persons Reported Enrolled

Model 3b is an imputational model of the event that persons with a CPS indication (explicit, edited, or imputed) of Medicaid coverage (Augmented-CAID is set) are found in MSIS to have received full Medicaid benefits. The universe is CPS reportees with a CPS indication of Medicaid coverage.

Covariates (showing file source and models used in) entered into the equations are:

- ***Age*** (Source: CPS; in Models 1a, 1b, 2, 3a, and 3b)
- ***Enrolled in Survey Month*** (Source: MSIS; in Models 1a and 2)
- ***Intensity of Coverage*** (Source: MSIS; in Models 1a and 2)
- ***Last Month of Coverage*** (Source MSIS; in Models 1a and 2)
- ***Male*** (Source: CPS; in Models 1a, 1b, 2, 3a, and 3b)
- ***Medicare Crossover*** (Source: MAX; in Models 1a and 2)
- ***Private Insurance*** (Source: MAX; in Models 1a and 2)
- ***Race/Hispanicity*** (Source: CPS; in Models 1a, 1b, 2, 3a, and 3b)
- ***Ratio to Poverty Level*** (Source: CPS; in Models 1a, 1b, 2, 3a, and 3b)
- ***Relationship to Survey Reference Person*** (Source CPS; in Models 1a, 1b, 2, 3a, and 3b)
- ***Service*** (Source: MAX; in Models 1a and 2)
- ***Source of CPS Insurance Data*** (Source: CPS; in Models 3a, and 3b)

- ***SSI Recipient*** (Source: MSIS; in Models 1a and 2)
- ***State*** (Source: CPS, MSIS; in Models 1b, 2, 3a, and 3b)
- ***TANF*** (Source: MAX; in Models 1a and 2)
- ***Zero Family Income Reported*** (Source: CPS; in Models 1a, 1b, 2, 3a, and 3b)

See Appendix III for complete variable specification.

IV. Results of Analysis

Note that results are analyzed in terms of enrollment during calendar year 2000 as reported in CPS/ASEC-2001. We believe that results for the subsequent year largely are consistent and can be explained in terms of the same factors.

Question 1:

Sample loss is a serious problem. Without creating new weights to account for invalid or missing SSNs, we would not be able to calculate a legitimate estimate of the undercount. More than one-fifth of the CPS sample cannot be used in the match analysis because respondents refused to provide an SSN for them or provided one that cannot be validated. There are 218,269 reportees (representing 279.5 million persons) for CPS/ASEC-2001. For 16,096 (representing 20.2 million persons), the SSN provided is invalid and for 28,206 (representing 45.5 million persons), the respondent did not provide one or allow a look-up. For this reason, we generated a second set of statistical tables that assign the weight of the unmatchable CPS sample to the matchable sample in a way intended to limit biases caused by re-weighting.

Question 2:

For CY 2000, the gross CPS underestimate of Medicaid enrollees is either 34.4%[12] (if CPS MCAID variable is used) or 42.1%[13] (if the Augmented-CAID variable is used). These rates are computed using a total count of 45,039,478 uniquely identified clients in the CY 2000 MSIS file (without a known date of death prior to March 2001). Direct comparability is obscured for several reasons discussed above (Under Section III, Q2). To make the MSIS count more comparable to the CPS Medicaid enrollment estimates; adjustments are made as follows for MSIS 2000:

1. Remove from count clients enrolled under SCHIP: reducing the MSIS count to 43,654,866 (*Table 2, CY 2000, Original Weight, U.S. Total, Total, MSIS Total B*).
2. Remove clients not receiving full benefits: reducing the MSIS count to 39,735,764 (*Table 2, CY 2000, Original Weight, U.S. Total, Total, MSIS Total C*).

[12] 1 - 29,533,238 (CY 2000, Table 2, Original Weight, U.S. Total, Total, CPS Total A) / 45,039,478 (CY 2000, Table 2, Original Weight, U.S. Total, Total, MSIS Total A).
[13] 1 - 26,072,203 (CY 2000, Table 2, Original Weight, U.S. Total, Total, CPS Total B) / 45,039,478 (CY 2000, Table 2, Original Weight, U.S. Total, Total, MSIS Total A).

3. Removing clients residing in group-quarters: reducing the MSIS count to 39,576,713 (*Table 2, CY 2000, Original Weight, U.S. Total, Total, MSIS Total D*).
4. Removing duplicate client accounts: reducing the count to 38,170,103 (*Table 2, CY 2000, Original Weight, U.S. Total, Total, MSIS Total E*).

Using this count, we find that CPS underestimates Medicaid enrollment by either 22.6%[14] with MCAID or 31.7%[15] with Augmented-CAID. An additional value of 36,216,390 (*Table 2, CY 2000, Original Weight, U.S. Total, Total, MSIS Total F*), excludes UN-identified clients from the previous. This simplifies reckoning the source of discrepancy by excluding non-linkable MSIS clients from consideration. By correspondingly excluding unlinked CPS reportees as well as those with edited or imputed responses for Augmented-CAID, the Augmented-CAID count is reduced to 18,416,133 (*Table 2, CY 2000, Original Weight, U.S. Total, Total, CPS Total C*).

Excluding non-matchable MSIS records and non-matched CPS records, the discrepancy between the MSIS count and the Augmented-CAID estimate is 36.2 M[16] – 18.9[17] M = 17.3 M. Of this, 33.4[18] M – 18.9 M = 14.5 M is due to the misclassification of Medicaid enrollment status among known Medicaid enrollees. This accounting is non-authoritative, but shows that the predominating factor associated with the discrepancy is the CPS misclassification of Medicaid enrollment status.

We can disaggregate the misclassification among known Medicaid enrollees as follows:

Reported Enrollment Misclassified	11.1 M[19]
Imputed Enrollment Misclassified	3.4 M[20]
Total Enrollment Status Discrepancy	14.5 M

Because imputation is meant to match reality at the aggregate level and not the individual level, the discrepancy attributable to imputation is to be expected and is offset by persons imputed to be enrolled, but not enrolled, which may be as high as 2.5 M[21] Also, because imputation is

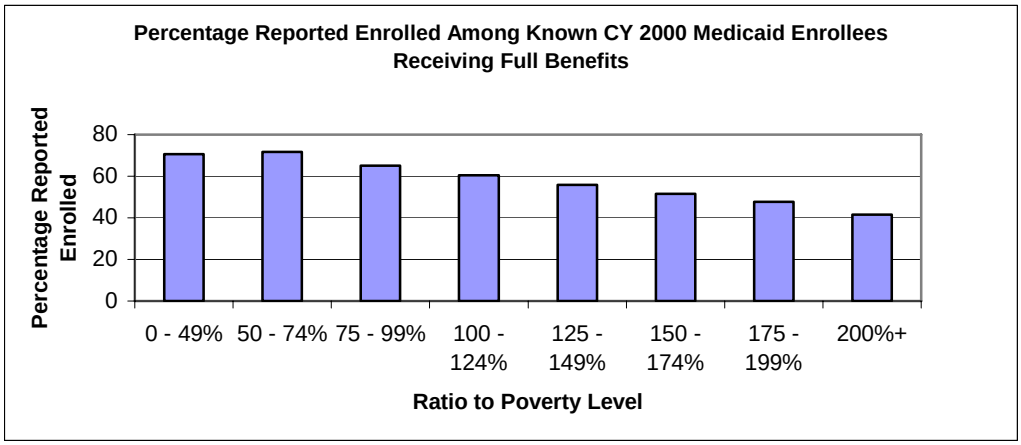
[14] 1 - 29,533,238 (CY 2000, Table 2, Original Weight, U.S. Total, Total, CPS Total A) / 38,170,103 (CY 2000, Table 2, Original Weight, U.S. Total, Total, MSIS Total E).
[15] 1 - 26,072,203 (CY 2000, Table 2, Original Weight, U.S. Total, Total, CPS Total B) / 38,170,103 (CY 2000, Table 2, Original Weight, U.S. Total, Total, MSIS Total E).
[16] CY 2000, Table 2, Original Weight, U.S. Total, Total, MSIS Total F.
[17] 13,355,301 (CY 2000, Table 3, Re-Weighted, Version A, Total Weighted Count, Persons Reporting Medicaid Only) + 5,733,020 (CY 2000, Table 3, Re-Weighted, Version A, Total Weighted Count, Persons Reporting Medicaid and Other Coverage).
[18] CY 2000, Table 3, Re-Weighted, Version A, Total Weighted Count, Total.
[19] 26,725,677 (CY 2000, Table 3, Re-Weighted, Version D, Total Weighted Count, Total) - 11,706,737 (CY 2000, Table 3, Re-Weighted, Version D, Total Weighted Count, Persons Reporting Medicaid Only) – 4,011,708 (CY 2000, Table 3, Re-Weighted, Version D, Total Weighted Count, Persons Reporting Medicaid and Other Coverage).
[20] 5,146,577 (CY 2000, Table 3, Re-Weighted, Version C, Total Weighted Count, Total) – 875,551 (CY 2000, Table 3, Re-Weighted, Version C, Total Weighted Count, Persons Reporting Medicaid Only) – 928,069 (CY 2000, Table 3, Re-Weighted, Version C, Total Weighted Count, Persons Reporting Medicaid and Other Coverage).
[21] 964,008 (CY 2000, Table 4, Re-Weighted, Version G, Total Weighted Count, Persons Reporting Medicaid Only) + 1,599,353 (CY 2000, Table 4, Re-Weighted, Version G, Total Weighted Count, Persons Reporting Medicaid and Other Coverage).

modeled solely from CPS interview responses, the discrepancy likely results directly from respondent misreports.

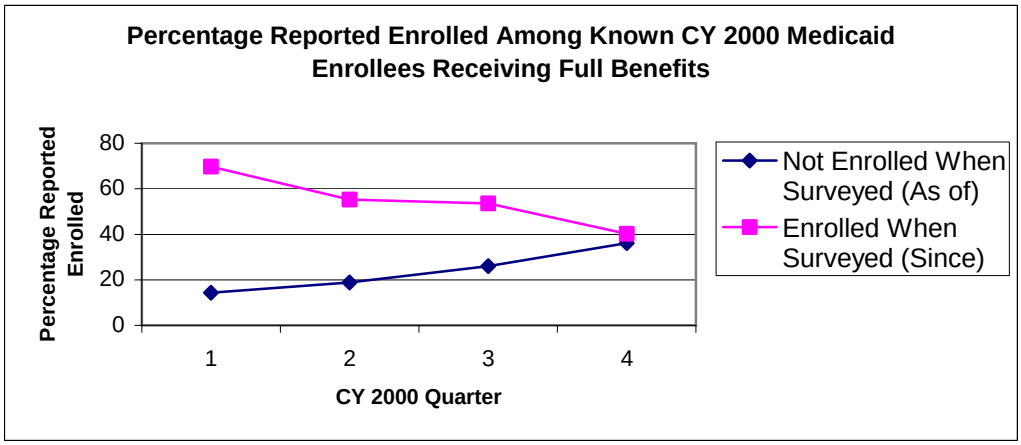
This failure to correctly report Medicaid for known enrolled reportees causes CPS to overestimate the number of U.S. residents with no insurance. Since these misreported reportees are counted (on a weighted basis) as non-insured rather than Medicaid-insured, an improved estimate of non-insured residents would re-classify them out of the uninsured category. In addition to the enrolled reportees we know are misclassified by CPS, there likely are enrollees whom we cannot identify as misclassified because we do not know their identity (that is PIK, replacing SSN) so cannot see that they too had been enrolled. But, it is also reasonable to expect that there are reportees who are classified as insured when they are not, which partially offsets the underestimation caused by those for whom Medicaid coverage is not reported. An improved estimate of uninsured persons would need to take into proper account all these factors. The team will release such an accounting subsequently to this report.

Question 3:

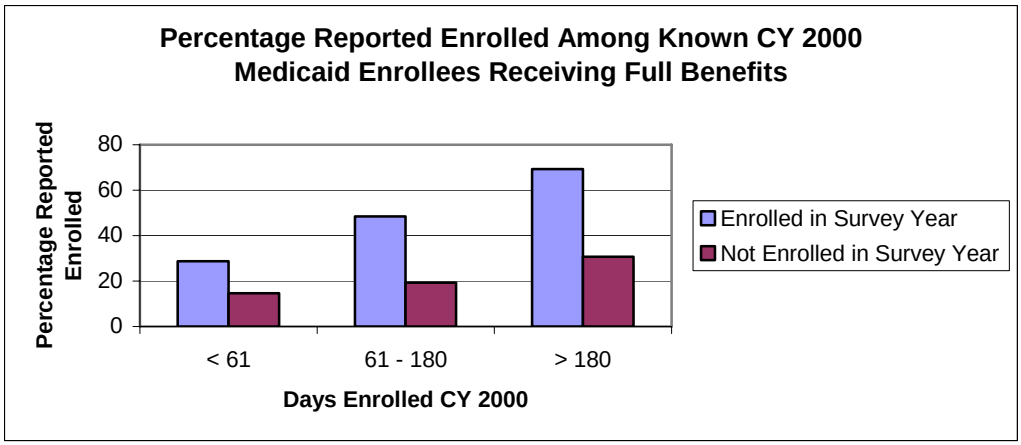
Table 3, CY 2000 Expanded Sample, Re-Weighted, Version D (in Appendix IV) shows that misreporting increases as poverty, recentness of enrollment, and length of enrollment diminish. The chart below shows a clear trend relating reported enrollment and poverty level:



Also, we see marked trends showing that enrollment is better reported the earlier that enrollment was initiated, or if the person is no longer enrolled, the later enrollment was terminated:

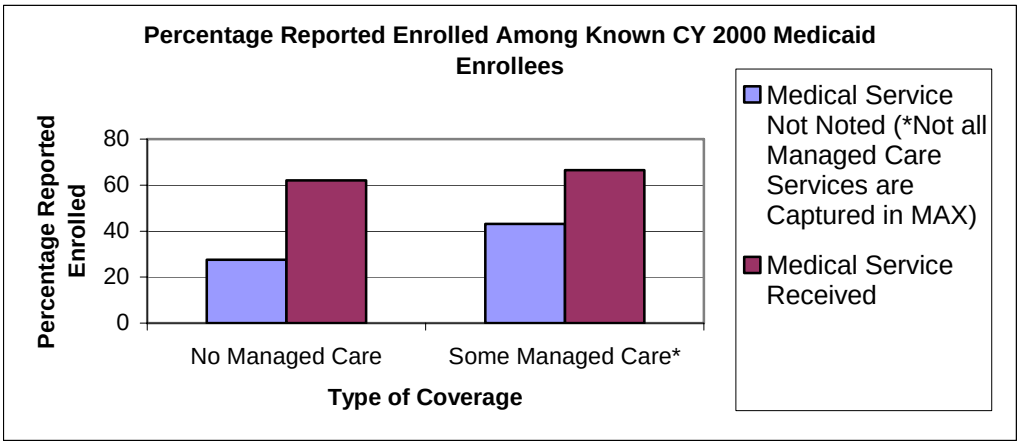


Related to the above trend, there appears to be a relationship between the number of days that a person was enrolled in Medicaid and the correct reporting of that enrollment for CPS:



Also notable is that enrollment is better reported for persons enrolled in the year the survey was administered compared to reportees who were no longer enrolled.

Another blatant result emerging from review of Table 3 is that the correct reporting rate of enrollees in a fee-for-service plan receiving medical services in calendar year 2000 is 61.1%, but for those not receiving medical services it is 27.2%. Similar differences are seen for persons enrolled in managed care:



To attempt to isolate the effect of the factors the tables above show are important in the bivariate setting, we perform multivariate analyses and report the results below

Question 5:

The results from the regression analysis are presented in Appendix V, Table 5. They show we can readily distinguish sample persons who have a high likelihood of having their coverage misreported from those with a low likelihood, and we can predict with some accuracy who was enrolled in Medicaid during the reference period and who was not.

Model 1a:

Modeling Reported Not on Medicaid for Known Full Benefit Enrollees:

The results from Model 1a show that level of poverty and last month of enrollment have the biggest effects on the odds[22] that a CPS respondent misreported an enrollee as not having Medicaid coverage. The poverty relationship appears monotonic: higher poverty being associated with lower odds of misreport. Service (received under Medicaid), specified based on enrollment in managed care or fee for service, also has a strong effect on odds. For example, the odds of misreport among individuals who received no medical services and were not enrolled in a managed care program are more than five times the odds of misreport among enrollees who were in managed care and had medical services noted. Another notable result is the lower odds of misreport for young enrollees and those with more intense coverage.

[22] Ratio of highest odds to lowest odds among categories defined by a variable. Note that for the last month of enrollment, the specified odds ratio must be taken to the eleventh power (representing the difference from 1 month to 12 months) to determine a comparable value.

Model 1b

Modeling Reported on Medicaid for Reportees Whose Enrollment Could Not Be Confirmed in MSIS:

In general, the effect of any one factor appears larger than in Model 1a, presumably due to fewer factors being included in the model. As in 1a, we see that poverty level has the biggest effect on the odds of respondent misreport. Here, this variable has the opposite effect: lower income is associated with higher risk of misreporting. Age also has a large effect on the odds of respondent misreport. In contrast with Model 1a, there appears to be no consistent pattern in misreport rates across age groups. There is a striking difference in odds for the lowest age category compared to all other age groups except 65 and older, which suggests the possibility that children enrolled in stand-alone SCHIP are being falsely reported as enrolled on Medicaid. There is more evidence for this possibility in the higher odds associated with being in the "Child" category compared to other categories of the variable for Relationship to Reference Person. Also, the results show respondents have substantially higher odds of misreporting an old person (age 65 and older) than a younger adult (age 18 to 44 and age 45 to 64), maybe because respondents are confusing Medicaid with Medicare. Also there are substantially higher odds of misreport for black and Hispanic non-enrollees than for others.

Model 2

Modeling Reported Not Insured for Known Full Benefit Enrollees:

Old and young enrollees have lower odds of being reported as having no insurance. This may relate to respondents being more aware of coverage opportunities for these groups because there are public insurance programs such as Medicare and SCHIP, dedicated largely to covering old and young people. Also, enrollees with more intense and more recent coverage have lower odds of being misreported as uninsured. Similarly, enrollees who received services have lower odds. It is interesting to note that poverty has substantially less effect on odds in this model than in Model 1a. This suggests the possibility that poverty represents a proxy for being less likely to have had private insurance in the reference period, with those persons having had both private insurance and Medicaid often being reported as having had only the private insurance.

Model 3a

Modeling Enrolled with Full Benefits for Persons Reported Not Enrolled:

Not surprisingly, the poverty variable stands out as the best for imputing true enrollment status from CPS data for people who were reported to have no coverage.[23] This reflects

[23] In terms of effect on odds ratio. See previous note.

income limits in Medicaid eligibility rules. There are also much higher odds of actual enrollment among young children than for other age groups. This could reflect program rules and the circumstances surrounding children's enrollment in Medicaid, namely the inability of their parents to find work while caring for them, which in-turn decreases their family's income.

Model 3b

Modeling Enrolled with Full Benefits for Persons Reported Enrolled:

As in Model 3a, the poverty variables stand out as the best among the 3b variables for imputing true enrollment status from CPS data for people who were reported as having coverage, but again, it is difficult to distinguish how much this result relates to group differences in rates of enrollment (in Medicaid and in other assistance programs that respondents may confuse with Medicaid) versus differences in rates of respondent error. Also, in this model, more so than the others, state of residence has a sizeable impact on the odds. Since what is being modeled is true positive reporting and states vary in how they administer and name their subsidized insurance programs (Medicaid, SCHIP, MEDCAL, MEDIKAN) and other types of other of assistance programs that may be confused with Medicaid, this suggests that how states administer and name programs may impact reports about coverage.

Summarizing the results across the models, we see that respondents appeared to report more accurately in the following circumstances:

- Reporting about white, non-Hispanic people.
- Reporting about people they can be expected to know more about (i.e., their spouse as opposed to their grown child or "other" person).
- Reporting about enrollees with more intense and more recent Medicaid coverage.
- Reporting about enrollees who can be expected to have more contact with the Medicaid program, given their type of coverage and receipt of medical services.

The best CPS variables for imputing true Medicaid status are the following:

- Poverty
- Race/ethnicity
- Relationship to reference person
- Age

We recognize that we are limited in how we interpret these results. Most obviously, the results are dependent on the particular variables in each model, both in terms of how they relate to one another and to hidden factors. For example, the results showing more error in reporting about blacks and Hispanics may relate to a hidden factor such as differences in household composition. Since we have not yet replicated these findings in studies of other surveys, we do not accept the results as conclusive evidence for any particular hypothesis.

V. Conclusion

Our research shows the CPS underestimates are mainly a reporting error problem:
Reportees on Medicaid during the reference period are often reported as not having been covered by it. Some even report being uninsured but the majority of the misclassified cases report some other type of coverage just not Medicaid. Our regression analysis shows that the major predictors of coverage are length of time, recency and poverty level.

Our research is limited by the fact that we were not able to attempt a link with all the MSIS cases due to missing identifiers on about 10% of the records. We could also not attempt to link all of the CPS cases due to missing identifiers (26% or so). Additional work is being done to see (though modeling) how our results reported here would be different if we had linking data for all data records. Also, we are conducting an investigation into how the universes from the CPS and MSIS match up with respect to institutional group quarters (Phase III of this project). With Phase IV, we plan to compare the results from the CPS to the NHIS.

VI. Limitations

Our ability to draw conclusion is limited by the quality of our input files, particularly MSIS, the success and accuracy of the algorithms (within the Person Identity Validation System—PVS) used to identify people on MSIS and CPS, and CPS sample error.

In Phase I of this study we investigated the quality of the MSIS file. The MSIS has some known quality limitations: incomplete and incorrect person identification (using the SSN field), person duplication (within and among states), and, from the perspective of our analysis, the inclusion of institutionalized persons, who are out of scope for the Current Population Survey. We have attempted to mitigate these factors in this analysis, but to a certain degree they impact results of the analysis presented here.

This issue of non-identification is serious and occurs also on CPS data and will we discuss this subsequently in this section (two paragraphs down). Duplication on MSIS is largely manageable by counting only once for persons with multiple client accounts, when the duplication is apparent (that is, the records have a common PIK, which replaces SSN). To the degree that we cannot perform this un-duplication because we do not recognize that several client accounts belong to the same person, our count of MSIS enrollees will be somewhat overstated. Also tending to cause an overstatement is the inclusion of institutionalized Medicaid enrollees within the MSIS file. We have sought to mitigate this issue through a procedure that looks to see if addresses available for MSIS enrollees on alternative available administrative record data are for institutions. However, we believe that this procedure was largely inadequate (see the discussion in Section III under Q2) and will attempt a better accounting for these CPS-out-of-scope persons in the Phase III analysis.

In addition to the known MSIS quality factors, the accuracy of MSIS in describing the enrollment status of Medicaid enrollees is critical to the validity of this analysis. To some degree we were able to review the quality of the MSIS in this regard in the Phase I analysis by looking at the quality of its geographic and dual-eligibility coding. These suggest that MSIS enrollment data are of high quality. However any inaccuracies in MSIS enrollment data will propagate to our generated statistics.

We believe that our person-identification routines (which seek to identify each person record with a unique PIK) perform with little error because the quality of their results have been continually evaluated over several years of use with varying types of data. Nevertheless, the lack of complete link-identification data (SSN re-coded as PIK) on both the CPS and MSIS mean that statistics derived from the status of the match of these files need to be carefully interpreted. Non-identified CPS reportees cannot have their enrollment status confirmed or established by reference to MSIS. For this reason, prior to re-weighting, non-identified CPS records are not useful for analyzing the accuracy of CPS reported Medicaid enrollment status, and the identified CPS records do not represent the whole CPS frame: non-institutionalized U.S. residents. Re-weighting corrects for this incomplete representation by shifting weight from the non-identified to identified reportees, but this introduces bias to match-derived statistics to the (unknown) degree that the missing-at-random assumption does not hold within the re-weighting strata. Non-identification within MSIS means that persons reported Medicaid-enrolled to CPS but not confirmed so by the match, may potentially be actual enrollees, and should not be assumed necessarily to be false positives.

Like all estimates derived from sample, ours are subject to the uncertainty engendered by the sampling: that is, the sample error. We do not present measures of possible sample error within the tables. Instead, we reference the Census Bureau's standard procedure for estimating error through generalized variance functions: http://www.census.gov/hhes/www/income/p60_231sa.pdf (see particularly, page 7). These functions give their users an idea about the level of error associated with each statistic but on a statistic-by-statistic basis may be substantially inaccurate.

We should also point out that the logistic regression techniques we used are in application as much an art as a science, and therefore it is likely that with additional effort or expertise that they can be improved upon. Still we think they are useful for identifying factors associated with reporting accuracy and for predicting enrollment status from survey results.

VII. Appendices:

I. Description of Four Project Phases
II. Key Decisions Leading to Phase II Research Design
III. Files and Methods Used
IV. Meta Data in Phase II
V. Detailed Tables and Documentation

APPENDIX I: Project Background

In 2004, Dr. Mike Davern from the State Health Access Data Assistance Center (SHADAC), University of Minnesota was funded by the Robert Wood Johnson Foundation to match enrollment data from seven states to the Current Population Survey (CPS) to study why the large discrepancy exists between CPS estimates and Medicaid enrollment counts. During the summer of 2004, Dr. Davern approached Census Bureau and Center for Medicare and Medicaid Services (CMS) officials about participating in the study. Realizing the amount of time that it would take to acquire the state data, Census officials offered the idea of conducting a national match first using a file they had already acquired: Medicaid Statistical Information System (MSIS) file. Census officials further suggested that a precursor to the national study could be a simple quality check on both the MSIS and the Medicare Enrollment Database (MEDB) files, which was in scope of current agreements and systems of records notices with CMS.

The Federal Health and Human Services Department (HHS) Office of the Assistance Secretary for Planning and Evaluation (ASPE) and SHADAC provided additional funding for the process. This money allowed for the national match and provided an opportunity to analyze the National Health Interview Survey (NHIS) and therefore bring its sponser, the National Center for Health Statistics (NCHS), into the study. Note that since NHIS asks a point-in-time question about Medicaid enrollment versus the CPS's "Have you been on Medicaid anytime in the calendar year?," the impact of timing (both for the reference period and its relationship to the moment of survey fielding) can be examined by comparison of results. Hence, the SNACC Team emerged, which is an acronym for the first initial of each of the participating agencies. After the first face-to-face meeting on the project, the SNACC team agreed to break the study into four distinct, but related, phases:

Phase I: Merging the National Level CMS Databases

In Phase I, we create a national database of health-insurance enrollment and evaluate the quality of the information it contains. We create the database by merging the CMS Medicaid Statistical Information System (MSIS) file with the CMS Medicare Database (MEDB) file (see Appendix III for an explanation of the research and supporting files). We evaluate the quality of the database by assessing our ability to accurately merge the input files and by comparing the characteristics of the individuals in the database to expectations based on Medicaid eligibility rules and characteristics of the U.S. population. (For more information, please see *Phase I Research Results: Overview of Medicare and Medicaid Files*, February 2007.)

Phase II: Matching the MSIS to the Current Population Survey (CPS)

In Phase II, we match data from MSIS and the Current Population Survey (CPS) according to a unique person-identifier (the Protected Identity Key or PIK, which replaces Social Security Number or SSN to protect reportee privacy). We supplement the matched records with information from the Medicaid Analytic eXtract (MAX), the Person Characteristic File (PCF), and the Master Address File Auxiliary Reference File (MAF-ARF) and examine why there are discrepancies between MSIS records of enrollment and CPS reports of Medicaid coverage (See hypotheses outlined below).

Phase III: Matching the State Frame and Person MSIS data to the CPS

In Phase III, we use data from the seven acquired state Medicaid file extracts, CPS, MAX, and the Census Bureau Master Address File (MAF) to enhance the comparison of MSIS enrollment data to CPS health insurance data developed in Phase II. The Census Bureau worked with CMS to negotiate the acquisition of the state Medicaid files that are intended to enhance the capability of finding matches with CPS person records because they include person names and addresses (in contrast with MSIS, which does not include these data elements). We analyze how better MSIS record person-identification and determination of out-of-CPS-frame status can impact Phase II results.

Phase IV: Matching the MSIS to the National Health Interview Survey (NHIS)

In Phase IV, we repeat the Phase II process, replacing the CPS data with NHIS data. In addition to providing explanations for discrepancies between the national NHIS and MSIS, comparisons to Phase II results will allow the examination of how survey design and implementation affect the quality of the resulting survey data and the estimates derived from them.

Hypotheses about the Discrepancy between Survey Estimates and Administrative Counts

In preparation for Phase II, III, and IV analyses, the team prepared a list of twelve hypotheses explaining the Medicaid enrollment count-survey estimate discrepancies and outlined some possible approaches to evaluating them:

1. Individuals enrolled in Medicaid who were residing in institutional group quarters were not designed to be included in the survey universe. However, they are included in the Medicaid administrative data. Unfortunately, it is not possible to identify all Medicaid enrollees living in group quarters by using the Medicaid administrative data so we cannot directly account for this universe difference. The best approach to evaluating this hypothesis would be to use MAX to identify persons who received Long Term Care (LTC) services (since they mostly receive such care in group facilities) and use the count as a measure of the magnitude of this factor.

2. Individuals enrolled in Medicaid who do not have a usual residence were not designed to be included in the survey universe. Unfortunately, it is not possible determine the usualness of an enrollees residence from their Medicaid administrative data so we cannot directly account for this universe difference. However, these individuals often receive correspondence at local social services offices, soup kitchens or other places so one approach to evaluating this hypothesis would be to run a frequency distribution to determine if many unrelated individuals are attributed to specific addresses.

3. Some individuals are enrolled in Medicaid for a very short period of time (catastrophic health event and related costs made them eligible – or they were resident aliens) so

respondents may not consider this coverage. Unfortunately, there is some conceptual question whether these individuals should be considered as "covered" by health insurance. One approach to evaluating the role of this conceptual confusion in the discrepancy between reports and actual receipt of benefits would be to evaluate survey reports after classifying individuals by length of time enrolled.

4. Some groups of Medicaid enrollees have restrictions on the Medicaid benefits they receive regardless of length of enrollment (for example, some dual Medicaid and Medicare enrollees who do not receive the full scope of Medicaid benefits, non-citizens who receive only emergency services, etc.) so respondents for enrollees in these restricted groups may not consider this coverage. However, as in #3 above, there is a conceptual question whether these individuals should be considered as "covered" by health insurance. One approach to evaluating this hypothesis would be to examine reports after classifying enrollees by type of Medicaid benefit they receive.

5. Some Medicaid enrollees are in pre-paid plans (e.g. HMOs - Health Maintenance Organizations, PHPs - Prepaid Health Plans, etc.) so respondents reporting about such enrollees may incorrectly report no coverage because they do not realize that Medicaid is the health insurance that pays for the enrollee's services. One approach would be to examine reports after classifying individuals by their type of Medicaid plan.

6. Medicaid is a state-based delivery system so enrollees may be counted more than once if they are enrolled in multiple states or multiple counties in the same state (e.g., because of moving during the year). There are also documented instances where states have changed identification numbers for selected individuals or all state enrollees. While these situations could cause double (or more) counting in administrative data systems, MAX processing attempts to minimize multiple counting within an individual state. However, because MAX and its source, MSIS, are organized into state-specific data sets, there is likely to be some enrollees and beneficiaries represented duplicatively across states. CMS began an examination of the extent of multiple counting across states in 2006 so one approach would be to evaluate what CMS results imply about the discrepancy between CPS estimates and Medicaid enrollment counts.

7. Some Medicaid enrollees did not receive Medicaid-provided medical services during the survey reference period so respondents reporting about such enrollees may incorrectly report no coverage because they may not realize or believe that the enrollee was nonetheless covered by Medicaid. One approach to evaluating this hypothesis would be to classify individuals by multiple categories (not eligible, eligible and not enrolled, enrolled and not receiving benefits, enrolled and receiving benefits). However, it is not possible to identify persons eligible and not enrolled in the Medicaid administrative data (because the system captures only those individuals who are actually enrolled) so under this approach it is necessary to use other sources (e.g. the Urban Institute Trim3 model) to estimate persons eligible and not enrolled. Also, the Census Bureau's 2001 Supplementary Survey (SS01) can be used to provide evidence of those eligible and not enrolled. This is outside the scope of this research but could be addressed in subsequent studies.

8. Medicaid eligibility is not assigned to an entire household (it is case-based or individual-based) so Census Bureau survey households containing multiple families or non-family members are most at risk for incorrect proxy responses. Even when a family and household have a one-to-one correspondence, if the survey respondent is not the applicant for Medicaid, there may be errors. One approach to evaluating this hypothesis is to examine reports after classifying individuals by relationship types.

9. Some Medicaid enrollees have co-insurance or personal or family liability for some share of the cost of their health care so respondents reporting about them may incorrectly report no coverage because they did not realize or believe that the enrollee was nonetheless covered by Medicaid. One approach would be to review Medicaid data elements that identify individuals with a Medicare deductible and/or coinsurance and that identify individuals with other insurance (this is known in Medicaid as third-party liability).

10. Some respondents may not distinguish the difference between types of health insurance (because they never knew the difference or in the survey they fail to apply the cognitive effort needed to distinguish the difference) so they may, for example, mistake Medicare or stand-alone SCHIP for Medicaid and vice-versa. One approach to evaluating this hypothesis would be to check survey results after classifying enrollees by dual eligible status and stand-alone SCHIP enrollment status.

11. Respondents may systematically make recall errors reporting about individuals who did not receive medical services from Medicaid or were not enrolled in the month in which they were surveyed.[1] One approach would be to check survey results after classifying enrollees by their Medicaid experience in the month of the survey.

Survey procedures may present biases for poorer populations, including the coverage of the survey frame (derived from the Master Address File or MAF) or non-response weighting. One approach to checking the MAF would be to match all Medicaid address records to the MAF to determine what proportion of Medicaid cases were out of the survey universe and study how those cases may differ from those that were correctly included in the survey estimate.

High-Level Research Requirements

- Identify the size of the discrepancy between MSIS enrollment counts and CPS enrollment estimates.
- Provide information and demographics (including family income as a percentage of the poverty threshold) on the false negatives (those who are enrolled in Medicaid but respond “no” on the CPS).

[1] Kim Mah of The Bureau Of The Census has analyzed possible response biases in CPS between Medicaid enrollees and non-enrollees. This analysis shows that any such response bias is relatively small. She will present the results of this analysis at the 2007 Joint Statistical Meetings.

- Provide information and demographics (including family income as a percentage of the poverty threshold) on the unconfirmed persons reported enrolled (those who are reported enrolled in Medicaid on CPS but for whom confirmation by linkage to an MSIS record does not exist). Note, only some of these persons are false positives. Others may be unconfirmable due to incomplete linking data (that is PIK, replacing SSN) on MSIS.
- Provide information on factors that are contributing to both sources of mis-alignment.
- Provide some measure of "time since covered" or "intensity of coverage."
- Provide information on what types of coverage false negatives are receiving, since they are not reporting Medicaid coverage.

Memorandum of Agreement

Given the number of entities and varied interest in Phase II, we decided that we would develop a gentleman's agreement among SNACC team members that would provide guidelines for any documentation emerging from the research. The intent was to protect all parties, while maximizing documentation and presentations. This agreement is provided as follows:

Memorandum of Agreement for Phases I and II of the SNACC Project

An Agreement for the Dissemination of Results of the Matched Survey and Administrative Records Project

SHADAC/University of Minnesota
US Census Bureau
Office of the Assistant Secretary for Planning and Evaluation
Centers for Medicare and Medicaid Services

INTRODUCTION AND PURPOSE OF THE MEMORANDUM OF AGREEMENT (MOA)

SHADAC/University of Minnesota (SHADAC), the US Census Bureau (Census), the Office of the Assistant Secretary for Planning and Evaluation (ASPE), and the Centers for Medicare and Medicaid Services (CMS) will work in collaboration to analyze and communicate results from the Matched Survey and Administrative Records data, henceforth called the SNACC data.

The SNACC project has been funded by SHADAC and the Robert Wood Johnson Foundation ($340,000) and by the Office of the Assistant Secretary for Planning and Evaluation ($150,000). The data requirements for the project include:

Validated National MSIS Files (CY 2000-2002)
Validated National EDB Files (CY 2000-2002)

MAX Files (CY2000-2002)
MAF-ARF (2001 and 2002)
Person Characteristic File (2001-2003)
Current Population Survey – Annual Social and Economic Supplement (2001-2002)

All micro-data analysis will be done by the US Census Bureau at the US Census Bureau as required in the Memorandums of Agreement (MOAs) developed by Census with CMS, and other existing agreements. **This MOA does not supercede or replace any provisions of other key documents among the several parties that address privacy, data use (e.g. CMS Privacy Board approval, and the CMS Data Use Agreement) or agreements between Federal agencies (e.g. the CMS/Census Bureau MOA**). A disclosure-reviewed summary file will be provided to SNACC team members, which includes pre-specified cross-tabulations. In addition some work on specific files might be conducted by SNACC team members who are provided special sworn status to work with these data at the US Census Bureau. In summary, any preliminary results will be disclosure-reviewed prior to SNACC Team receipt.

Each collaborating organization offers expertise in needed areas of health policy, administrative records, survey design, policy simulation, analysis, and dissemination. The purpose of this MOA is to clarify roles and responsibilities for each participating organization in the analysis, publication and presentation of the SNACC data set. Specifically, this MOA includes consensus statements regarding:

- Roles of collaborating Project & Organizations Advisory Team
- Decision-making processes
- External communications and publications

ROLES OF PROJECT AND ORGANIZATION ADVISORY TEAM

SNACC Phase I and Phase II Collaborating Organizations

SHADAC/University of Minnesota:

- Michael Davern
- Kathleen Thiede Call
- Lynn A. Blewett

US Census Bureau:

- Ronald C. Prevost
- Dean M. Resnick
- Michael Berning
- Charles T. Nelson
- Cheryl H. Lee

Office of the Assistant Secretary for Planning and Evaluation:

- Robert Stewart
- George Greenberg
- Kate Bloniarz
- Jacob Klerman (Consultant from RAND)
- Others

Centers for Medicare and Medicaid Services:

- Dave Baugh
- Gary Ciborowski
- Cheryl Camillo
- Robin Dalton

SNACC Project Advisory Team

Each collaborating organization listed below will contribute one or more member(s) to serve on the SNACC Project Advisory Team. Others will be called in when required. The Project Advisory Team will jointly oversee the SNACC project. In addition, the following are joint activities for the collaborating organizations:

- Analysis of results
- Report writing
- Article authorship and
- Determination of presentation venues & publications

Project Advisory Team Leader: Mike Davern

Team Members

- Ronald C. Prevost
- Robert Stewart, George Greenberg and Jacob Klerman
- Dave Baugh

EXTERNAL COMMUNICATIONS & PUBLICATIONS PROCESS

The Project Advisory Team will serve as the decision-making body for external communications and publications. All communications with the media or the general public on behalf of this project will be planned and receive approval from the Project Advisory Team. Any comments, public announcements, scientific presentations and publications regarding SNACC will reflect equal credit among collaborating organizations. All written presentations should use the following citation:

This work was funded by RWJF, OASPE, and SHADAC and benefited greatly from input from the work of the US Census Bureau, Centers for Medicare and Medicaid Services, Office of the Assistant Secretary for Planning and evaluation.

All topics for communication including press releases, communication to external audiences, brochures, web site postings, abstract submissions, and scientific publications will be reviewed and approved by the Project Advisory Team.

In addition, some authors/co-authors work for organizations that require additional review and approval of the press releases, reports, and external communication. It will be the author's/co-author's responsibility to ensure that his organization reviews/approves these type of communications. If an organization will not allow its employee to be a co-author, the co-author is to negotiate with the lead author to make changes to satisfy organization concerns or to remove self as co-author.

All issues surrounding communications including authorship, choice of topic(s), roles in analysis and writing, discussion regarding implication(s) of results, deadlines, cost sharing, and presentation format (e.g., brochure, conference presentation, journal article, etc.) should be mutually agreed upon by the Privacy Advisory Team prior to work beginning. Process is as follows:

1. Individuals working in all organizations may submit communication ideas to the Project Advisory Team. Communication ideas should include a brief description of:
   - the research question(s)
   - format (i.e., brochure, web site table, conference presentation, journal, etc.)
   - justification for question & format
   - suggested co-authors

2. The Project Advisory Team reviews all potential topics, and assigns:
   - lead author and co-author(s)
   - allotted time frame and priority status.The purpose of a priority status is to ensure that the small number of people who run the data analyses are not overwhelmed with competing requests.

3. The lead author is responsible for working with co-authors to ensure that analysis and communication is completed in accordance with an allotted time frame established by the Project Advisory Team. If it is not completed within the allotted time frame mutually agreed upon by the Advisory Team, the transfers the topic to another lead person.

4. The Project Advisory Team is responsible for reviewing any version of communication, presentation, or publication for privacy sensitivities and content concerns. The lead author(s) needs to review any comments (privacy/content) received from the Project Advisory Team. The comments received from the Project Advisory Team relating to privacy concerns are not subject to discussion with the lead author(s).

5. If the lead author(s) does not agree with the Project Advisory Team's comments concerning content, the Project Advisory Team and the lead author(s) need to discuss (i.e., conference call) before any final version of communication, presentation or publication. Once a final version of the communication, presentation or publication is prepared, the Project advisory Team needs to review. If the majority of the Project Advisory Team (three organizations) are not satisfied with the final version, another conference call with the lead author(s) and the Project Advisory Team may be required. If a consensus can not be reached among all five organizations of the Project Advisory Team during the conference call, then the dissenting members of the Team are free to write their own article or report rebutting their work of the others (preferably to be submitted to the same journal as a research note) or in the case of a report; a text box, footnote, appendix, or disclaimer can be inserted (if published by one of the five participating organizations) highlighting the point of disagreement.

6. Organizational Reviews: If a communication, presentation, or publication refers to CMS or Census Bureau personnel as co-authors, the document must undergo appropriate organizational review. Additionally, appropriate disclaimers for publications published with CMS or Census Bureau co-authors should be used. The CMS disclaimer is: “The Centers for Medicare & Medicaid Services (CMS) have reviewed your subject manuscript. CMS approves the use of CMS data and does not represent a CMS endorsement of or comment on the actual manuscript itself.” The Census Bureau’s is: “This report is released to inform interested parties of ongoing work and to encourage discussion of work in progress. The views expressed are those of the author and not necessarily those of the U.S. Census Bureau.”

AGREEMENT ON MOA STATUS

All parties agree that this Memorandum of Agreement does not constitute a contract, but rather an agreement that describes the nature of the collaborative relationship and agreement between those persons within the organizations contributing to the SNACC project. This document represents consensus of the team members. **This document in no way is to interfere with existing data sharing agreements between CMS and the Census Bureau or CMS and the states.**

LIST OF PUBLICATIONS, LEADS AND CO-AUTHORS:

1. Reports
2. Peer-reviewed publications
    a. General Phase II results: Lead author is Michael Davern
    b. Modeling implications of Phase II results: Lead author is Jacob Klerman
3. Conference presentations
    a. General phase II results presented at the Joint Statistical Meetings by Michael Davern
    b. General phase I results and problem set up by Dave Baugh at NAWRS
    c. General Phase II results presented at NAWRS by Ron Prevost
    d. General phase II results presented at the Academy Health by Michael Davern
    e. Phase II results presented at the Association for Public Policy Analysis and Management by Michael Davern
    f. Federal Committee Statistical Methodology (FCSM)
    g. National Committee on Vital and Health Statistic (NCVHS)
4. Other Presentations (e.g., American Enterprise Institute meetings, congressional testimony, intra-agency presentations, etc.)

Appendix II: Key Decisions about Phase II Analyses

The actual implementation of the decisions described here is detailed in Appendix V.

Restricted Benefits Flag (Monthly)

Decision: Consider an individual to be enrolled in Medicaid with Full Benefits if he/she is a code 1 (full benefits) or code 4 (pregnancy).

Rationale: On the MSIS, clients can be coded in 6 different ways. Code values 1=full benefits, 2=alien, 3=dual enrollee, 4=pregnancy, 5= other, and 6 = (family planning). Codes 2, 3, and 6 are clearly without "meaningful insurance coverage". Initially, although there may be some uncertainty as to exactly what coverage persons with code value = 4 (pregnancy) and 5 (other) may have received, the initial recommendation was to include them as persons without "meaningful insurance coverage". However, based on subsequent research conducted by ASPE officials, the team decided to include code 4 (pregnancy) as having full benefits. The table below illustrates the heavy usage of pregnancy services in New Jersey.

Appendix Table 1. Percentage of Enrollees Receiving A Service in New Jersey

Variable	Full Benefits	Restricted Alien	Restricted Duals (QMBY, SLMBY)	Restricted Pregnancy	Restricted, Other (SA, Medically Needy)	Unknown
Inpatient	7%	59%	0%	11%	10%	6%
Physician	21%	29%	0%	43%	30%	8%
Dental	7%	0%	0%	3%	28%	1%
Other Practitioners	5%	0%	0%	2%	13%	1%
Outpatient	20%	6%	1%	79%	35%	8%
Clinic	8%	7%	0%	45%	7%	3%
Lab	11%	4%	0%	60%	14%	4%
Rx	29%	1%	2%	50%	83%	14%
Other Service	7%	0%	0%	1%	68%	3%
HMO	73%	1%	0%	40%	9%	20%
PHP	4%	0%	1%	0%	18%	3%

Chip Code (Monthly)

Decision: Include persons in Medicaid-expansion SCHIP programs as Medicaid enrollees. Exclude persons who are in stand-alone SCHIP programs.

Rationale: Enrollment in SCHIP is identified monthly using this variable. A Medicaid-expansion SCHIP enrollee should also have Medicaid eligibility in the month. An enrollee in a non-Medicaid stand-alone SCHIP program should not have Medicaid eligibility in the month. Instructions to states about reporting of SCHIP in MSIS may create confusion. States are told to report all Medicaid-expansion SCHIP enrollees and their services through MSIS. States have the option to report non-Medicaid stand-alone enrollees in MSIS. Some do, some don't, and some report enrollment for some non-Medicaid stand-alone enrollees and not others. States are told not to report services for non-Medicaid stand-alone SCHIP enrollees in MSIS.

Eligibility

Decision: A person is considered eligible for Medicaid if he or she has been on Medicaid for at least one day.

Rationale: The CPS asks the respondent, “Have you received Medicaid in the last year?” There is no agreed upon length of time that a person must be on Medicaid in order to be considered “covered.” For that reason, we decided that one day of enrollment constitutes being eligible, which may result in high false negative rates as people on for only one day may not consider themselves as having had Medicaid. Some of this should surface when we look at days of eligibility and its relationship to a correct response.

Persons Enrolled in Medicaid Who Receive No Benefits

Decision: Use the MAX Person Summary File to classify enrolled individuals as receiving benefits (that is, medical services) or not receiving benefits.

Rationale: CMS experience with Medicaid enrollment has revealed that 15-20% of enrollees never use any services in a year. This is an average across Medicaid eligibility groups (e.g. adults, children, aged, disabled). We have not examined the question thoroughly for several years, but results were somewhat counterintuitive in that the highest percentage of non-users was medically needy children. The finding makes sense in the context of Medicaid enrollment being case-based. For example, a Section 1931 (AFDC rules) women with five dependent children may receive enrollment as a medically needy case. However, she may not take the children for well-child care. It is possible that the only child who receives care is the sick one that caused her to seek Medicaid eligibility. Survey respondents may not consider themselves to have health insurance (e.g. Medicaid coverage) if they were enrolled and but did not receive benefits.

Basis of Eligibility - BOE (Monthly) and Maintenance Assistance Status - MAS (Monthly)

Decision: Use the MAS value = 1 (receiving cash or eligible to) in conjunction with BOE code values =1 (aged) or 2 (blind/disabled) to identify persons receiving SSI cash payments. The TANF flag=2 (individual received TANF benefits) will be used to identify persons receiving TANF benefits. (The 2000 MSIS that the Census Bureau received did not contain the TANF flag.)

Rationale: Individuals whose eligibility is based on receiving cash are more likely to know that they are on Medicaid and to respond correctly to the CPS. This can be tested with the variables on MAX in which BOE and MAS are combined into a single data element. Some states did not populate the field so we used whether the person's record contained the 1931 indicator because the 1931 and TANF eligible roughly represent the same group.

Out of Scope Persons

Decision: Using MAX, move those MSIS persons who are either living in institutional Group Quarters (e.g., prisons, nursing homes) or who have no usual residence from the universe to be studied.

Rationale: Individuals enrolled in Medicaid that were residing in institutional group quarters are not included in the survey universe so are not matchable. Likewise, persons enrolled in Medicaid and have no usual residence are also not included in the survey universe so are not matchable. Hence, removing these two subpopulations is important to aligning the MSIS and CPS universes to ensure meaningful comparisons and inferences. However, because our address data are not complete, we will revisit this issue in Phase III when we have state MSIS data that includes complete addresses.

Persons Enrolled in Medicaid in More than One State

Decision: Persons with duplicate records in MSIS are only counted once at the national level. In state-level tallies, these persons are counted once, under *State is Unknown*.

Rationale: Un-duplicating MSIS records and removing duplicates is important to aligning the MSIS and CPS universes to ensure meaningful comparisons and inferences.

APPENDIX III: Description of Files and Methods in Phase II

Research Files

Medicaid Statistical Information System (MSIS)

The Medicaid Statistical Information System (MSIS) is the basic source of state-submitted eligibility and claims data on the Medicaid population, their characteristics, utilization, and payments. Beginning with Fiscal Year 1999, the Balanced Budget Act (BBA) of 1997 requires states to submit all their eligibility and claims data to CMS on a quarterly basis through the MSIS.

Medicaid Analytic eXtract File (MAX)

The MAX – formerly known as State Medicaid Research Files (SMRFs) – are a set of person-level data files on Medicaid eligibility, service utilization, and payments. The MAX data are extracted from the MSIS. The MAX development process combines MSIS initial claims, interim claims, voids, and adjustments for a given service into this final action event. Unlike fiscal-based MSIS quarterly files, MAX is an annual calendar year file.

Current Population Survey (CPS) Annual Social and Economic Supplement (ASEC)

The CPS ASEC is an annual survey of approximately 78,000 households nationwide. The ASEC, formerly known as the March Supplement to the Current Population Survey is a basic source for health insurance coverage data. The population represented is the civilian non-institutional population living in the United States. Most of the data from the CPS ASEC were collected in March (with some data collected in February and April).

In September 2000, the CPS began an expansion of its sample to accommodate increased funding provided by the State Children's Health Insurance Program (SCHIP). Although focused primarily on the ASEC sample, the SCHIP funding provided for an approximately 20 percent increase in the basic CPS sample. This expansion, which occurred in 31 small states and the District of Columbia, was completed in November 2000. Over the next several months, both the BLS and the Census Bureau monitored the impact of this expansion on the CPS labor force estimates, and the BLS decided to begin using the expanded sample in its official CPS estimates in July 2001. Since the focus of this expansion was on estimates of children's health insurance coverage, the CPS ASEC sample was also increased by bringing back three rotation groups of households from the summer of the previous year also asking the ASEC in the rotation groups in February and in April that are not part of the ASEC sample for the month of March. Interviewing in these rotation groups is limited to all minority households and White households with children under 18.

Support Files

Person Characteristics File

The Person Characteristics File (PCF) is a Census Bureau file that holds basic person-level descriptive data for all persons who have a Social Security Number (SSN). For each represented person, PCF holds summarized Social Security Administration (SSA) Numident data, consisting of a single record. In addition, the PCF holds a modeled race, ethnicity and gender for these same persons as well as Census 2000 reported race and ethnicity when available.

Master Address File Auxiliary Reference File

The Master Address File Auxiliary Reference File (MAF-ARF) is an annually-compiled Census Bureau file with only two fields: Master Address File Identifier (MAFID) and Protected Identification Key (PIK). The MAFID is the identity key for a Census Bureau's Master Address File (MAF) record and each represents a specific address. The PIK is a unique person-identifying code that replaces the Social Security Number to protect represented-persons' privacy. Each MAF-ARF records reflects that the person represented by the PIK is shown in the Census Administrative records collection associated (through residence or some other means) to the address represented by the MAFID.

Research Methods

Person Identification Validation System

The Person-Identification or ID Validation System (PVS) provides a fully automated production capability at the Census Bureau for Social Security Number (SSN) verification, search, and assignment. Once an SSN is either verified or searched for and assigned, the record is considered validated. The PVS is managed by the Administrative Records Research Staff. The PVS enables SSN verification, search, and assignment for regularly repeating demographic surveys such as the CPS and SIPP, as well as for other demographic or administrative files. The PVS also expands data linkage capabilities for merging survey and administrative data sets.

The PVS uses probabilistic matching to verify SSNs contained within an incoming file against those contained within the Census Numident. The processing consists of a verification phase followed by a two-step search phase. For the verification phase, SSNs are matched using several types of demographic data, including names, dates of birth and gender. Specific weights are set to define acceptable matches. Any records not verified through this phase – or without an incoming SSN – are sent forward to the search phase of the system. (Note: In conformance with Census Bureau privacy policy, the PVS does not process any record for which the respondent has refused to provide an SSN. Also, due to technical constraints, the PVS does not process records where the first name and surname are missing.)

The search phase of the PVS, also based on probabilistic matching, comprises a geokey (address-based) search, followed by a name search. The geokey search consists of logically grouping or "blocking" the data using the geokey, and then progressively relaxing the geographic criteria

while undertaking five passes through a matching routine to achieve agreement on demographic data as cited for the verification phase. Unmatched records remaining after the geokey search fall to the name search, where they undergo a similar demographic matching process but without the use of the geokey.

The final output file of the PVS (created after completion of the verification and the search phases) contains: all records with verified or searched and assigned SSNs; all records where the SSN could not be verified or searched and assigned or where multiple and, therefore, inconclusive SSNs were found; and, all original records withheld from the PVS process due to refusals or wholly blank names. A record is considered validated when it successfully completes either the verification or the search and assign phase. Only validated records can be used in record linkage.

Adjusting the weights in the CPS to account for people missing SSN

Many sampled persons in the CPS are missing SSN because the respondent refused to provide it, or we were unable to identify it using the Person-ID Validation System. For this reason, we adjust the weights of persons for whom we have the SSN to account for those missing it, and remove the missings from the data file. The re-weighted data represent the whole survey frame.

The procedure is similar to the non-response weighting adjustment the Census Bureau and other survey researchers use. Appendix Table 2 illustrates a non-response weighting adjustment by age and sex in a hypothetical survey of 1,000,000 persons (with known age and sex characteristics) and a sampling rate of 1 in 1,000. The number of sampled persons by age and sex is in Column 2. In the CPS, the population controls are by age, race, and sex for each state. Column 3 contains the number of sampled persons in each group responding to the survey. Response varies by group. For example, young males have an especially low response rate, as listed in Column 4.

The base weight of each sampled person, 1,000, is the inverse of the sampling rate. The procedure adjusts the base weight in Column 5 by the inverse of each group's response rate (Column 6) to produce the new weight in Column 7. Essentially, respondents with certain characteristics cover those with the same characteristics who didn't respond.

Note that multiplying the base weight of each group times the number of sampled persons and summing the products gives the number of people in the population, 1,000,000. Performing the same calculation with the new weight and the number of responses produces the same number, 1,000,000.

Appendix Table 2. Example of a Non-response Weighting Adjustment

1	2	3	4	5	6	7
Age/Sex Group	Sampled Persons	Responses	Response Rate (Percent)	Base Weight	Adjustment Factor	New Weight
YM	100	60	60.0	1,000	100/60	1,667
MM	250	188	75.0	1,000	100/75	1,333
OM	100	90	90.0	1,000	100/90	1,111
YF	100	80	80.0	1,000	100/80	1,250
MF	300	255	85.0	1,000	100/85	1,176
OF	150	142	95.0	1,000	100/95	1,053
Total	1,000	815	81.5			

Note: Groups are Young, Middle, Old; Male, Female. Sampling rate is 1 in 1,000 of 1,000,000-person population.

We use a similar procedure to adjust the weights of people in the CPS. Here, we are adjusting for missing SSN instead of missing response. For the CPS weighting adjustment, we calculate an adjustment factor in the same manner as the above example, by groups based on the variables most important to the research at hand, namely, age, relative poverty, health insurance status, and whether health insurance status was imputed.

Age	A 0-5 B 6-17 C 18-64 D 65 and up
Relative Poverty	A 0% to 99% B 100% to 199% C 200% and up
Health Insurance Status	1 Medicaid 2 Other public only 3 Private only or other public/private 4 [not used] 5 Uninsured
Imputation of Health Insurance Status	I Imputed N Nonimputed

Note that in the above example, knowing the population's age and sex characteristics allows us to calculate adjustment factors for groups. In the CPS, we create groups based on persons' characteristics known because the Census Bureau collected (or imputed) the information in the survey.

Some of the groups created by crossing all of these variables were very small. We therefore collapsed them into other cells in order to bring the count (in each cell after the collapsing procedure) to at least 50. Specifically, in all age/poverty groups with imputed health insurance

status, we combined *Other public only* with *Medicaid*. For the *Uninsured, 65 and up* group, we combined the poverty categories, and we combined the imputation categories.

After calculating the adjustment factors for the groups, we apply the appropriate factor to each sampled person's CPS weight, which the Census Bureau has already calculated for each person based on many characteristics. The adjustment factors, each the inverse of the SSN existence rate in the group, are in Appendix Table 3

Appendix Table 3. Weighting Adjustment Factors, March 2001 CPS Expanded Sample

Age Group	Relative Poverty	Health Insurance Status	Imputation of Health Insurance Status	Cell Count	Weighted number of persons (thousands)	Weighted number of persons with SSN (thousands)	Percent with SSN	Adjustment Factor

Regression Analysis Variable Specification

Response Variables:

Full Benefits (in Models 3a and 3b)
A dichotomous dependent variable from MSIS indicating that the CPS person is in the MSIS database as having received full Medicaid benefits during the reference period.

Reported Enrolled (in Models 1a and 1b)
A dependent dichotomous variable from CPS indicating that the respondent explicitly reported Medicaid coverage (Augmented-CAID set) for the survey person.

Uninsured (in Model 2)
A dichotomous dependent variable from CPS indicating that the CPS person was explicitly reported as having no health insurance.

Covariates:

Age (in Models 1a, 1b, 2, 3a, and 3b)
An independent ordinal variable recoded into six categories from the CPS age variable. The odds ratio is the effect of being in a given category relative to average.

Enrolled in Survey Month (in Models 1a and 2)
An independent dummy variable from MSIS indicating that the person received Medicaid with full benefits (excluding SCHIP coverage) in the month they were surveyed. The reference category is persons who had Medicaid during the reference period but not in the month of the survey.

Intensity of Coverage (in Models 1a and 2)

An independent continuous variable from MSIS representing the number of days covered with full benefits (excluding SCHIP coverage) as a percentage of the number of days from January 1 to the last day of the last month of coverage with full benefits (excluding SCHIP coverage) in the reference period. For example if a person had coverage for 100 days and their last month of coverage in CY 2000 was June, then their intensity of coverage for the CY 2000 reference period is 100 / 181 = 0.552. The odds ratio is the effect of having continuous coverage from January 1st to the last day of their last month of coverage compared to having no coverage (which is only possible as a theoretical construct – because in this case, having no days of coverage, they would not have been a Medicaid enrollee) during this period.

Last Month of Coverage (in Models 1a and 2)
An independent ordinal variable from MSIS corresponding to the number of the last month in which the person had Medicaid coverage for full benefits (excluding SCHIP coverage) during the reference period. For example, if a person's last month of coverage during the reference period was June, this variable will have the value **6**. The odds ratio is the effect of having coverage one month more recently.

Male (in Models 1a, 1b, 2, 3a, and 3b)
An independent dummy variable indicating that the CPS person is male. Females are the reference category.

Medicare Crossover (in Models 1a and 2)
An independent dummy variable from MAX indicating that the person had both Medicare and full Medicaid coverage during at least one month of the reference period. In Models 1a and 2, people with full Medicaid coverage but no Medicare during the reference period are the reference category.

Private Insurance (in Models 1a and 2)
An independent dummy variable from MAX indicating that the person had private insurance at the same time the person had Medicaid in at least one month during the reference period. Enrollees with no indication of private insurance are the reference category.

Race/Hispanicity (in Models 1a, 1b, 2, 3a, and 3b)
An independent nominal variable constructed from the CPS items for race and ethnic origin. Categories include: Hispanic of any race, non-Hispanic black, non-Hispanic American Indian/Aleut Eskimo, non-Hispanic Asian or Pacific Islander and non-Hispanic white. Odds ratios are the effect of being in a given category relative to the average.

Ratio to Poverty Level (in Models 1a, 1b, 2, 3a, and 3b)
An ordinal independent variable representing the ratio of the CPS person's family income to the federal poverty level. There are eight categories ranging from 0-49 percent of the poverty level (for the person's family size) to greater than 200 percent of the level. Odds ratios are the effect of being in a given category relative to average.

Relationship to Survey Reference Person (in Models 1a, 1b, 2, 3a, and 3b)
An ordinal independent variable from CPS indicating the person's relationship to the survey reference person (usually the respondent). Categories include: Child, Self, Parent, Spouse, and Other. Odds ratios are the effect for the given category relative to average.

Service (in Models 1a and 2)
An independent nominal variable from MAX representing enrollee experience receiving Medicaid services. The five categories indicate both whether the Medicaid enrollee had any coverage through a managed care program and whether there is a record of the person receiving a medical service. Note that states do not have to collect or send CMS information about services provided to enrollees in pre-paid plans so having no record for a person in managed care is not necessarily an indication that the person did not receive medical service. Categories include the following:

1. Not on managed care and no medical services received
2. Not on managed care and medical services received
3. In managed care and medical services noted
4. In managed care and medical services not noted
5. Unknown (MAX record not available for this person)

Source of CPS Insurance Data (in Models 3a and 3b)
An independent nominal variable from CPS indicating how the person's Medicaid status was reported. Categories include edited, imputed, and explicitly reported. Note that there can be no edited category in Model 3a because it models the event that persons with no CPS indication of Medicaid coverage are found in MSIS but CPS edits only change responses to *coverage indicated*.

SSI Recipient (in Models 1a and 2)
An independent dummy variable from MSIS indicating that the person received Supplementary Security Income (SSI) in at least one month during the reference period. Enrollees who are not SSI recipients are the reference category.

State (in Models 1a, 1b, 2, 3a, and 3b)
A nominal independent variable from CPS or MSIS for state of residence. For each CPS person, if a matching record is found for him or her in MSIS, this variable comes from MSIS, otherwise it comes from CPS. Note if MSIS shows more than one state of residence for a person, that person is assigned a value *Unknown* for this variable. Odds ratios are the effect of being in a given state relative to average.

TANF (in Models 1a and 2)
An independent dummy variable from MAX indicating that the person's eligibility for Medicaid is based on qualification under Section 1931 (which were the rules for eligibility under AFDC when AFDC was still operative). Note that a person may be in TANF but eligible for Medicaid for some other reason. We use this item instead of the MAX item indicating that person is in TANF because some states do not provide this information but all states provide information on the basis of eligibility. Persons who are eligible for reasons other than under Section 1931 are the reference category.

Zero Family Income Reported (in Models 1a, 1b, 2, 3a, and 3b)
An independent dummy variable indicating that the CPS shows the person's family with zero income. CPS persons with positive family income are the reference category.

APPENDIX IV: Meta Data in Phase II

In this section names of variables on input files are shown in this ***FONT***, names of derived variables are shown in this ***FONT***, and constants are shown in this **font**.

SSN Validation:

We validate MSIS SSNs against the Census Numident to minimize the chance that linked MSIS-CPS records do not represent the same person. The validation procedure compares date-of-birth and sex on the MSIS record to those values on the Numident record indexed by the same SSN. The MSIS SSN is considered valid if any of the following obtains:

- The date of birth on both is the same.
- The difference in year-of-birth is one year or less, month-of-birth is the same, day-of-birth is the same, and sex is the same.
- Year-of-birth is the same, sex is the same, and month-of-birth and day-of-birth are the same after transposition (example: MSIS DOB: 08/10/1961, August 10, 1961, is validated by Numident DOB: 10/08/1961, October 8, 1961, as long as sex is the same).

SSN Rationalization:

We performed a rationalization procedure because in some cases, MSIS records sharing the same MSIS-Identification-Number have different personal identity data: ***SSN, DATE-OF-BIRTH,*** and ***SEX***. The rationalization procedure insures that the data on each record having the same ***MSIS-IDENTIFICATION-NUMBER*** are set to the probable correct values. The probable correct values are determined as the values on the record having best validation result (that is, validated ***SSN*** records come before non-validated ***SSN*** records) and secondly the earliest calendar month. Rationalization was performed separately for each year's set of MSIS data.

MSIS Summarization:

We summarized MSIS records (after validation and rationalization processing) so that we would have only one record for each person and variables in a form appropriate for our analyses. For records with validated SSNs, all records (applicable to a given calendar year) with the same SSN value are summarized to produce a single record. For records without a validated SSN, all records (applicable to a given calendar year) with the same combination of State and ***MSIS-IDENTIFICATION-NUMBER*** are summarized to produce a single record. The summarization developed the following variables describing the represented person and their Medicaid enrollment status:

- Valid SSN Status (***VALID_SSN_STATUS***)
  From modified Census PVS validation
  1 – Yes
  2 – No

- Enrolled in Medicaid with Full Benefits (***FULL_BEN***)

  For <u>at least</u> one month of reference year, ***RESTRICTED-BENEFITS-FLAG*** in (**1**, **4**) and ***DAYS-OF-ELIGIBILITY*** > **0** and ***SCHIP-CODE*** = **1**)

  1 – Yes

  2 – No

- Enrolled in Medicaid with Any Benefits (***ANY_BEN***)

  For <u>at least</u> one month, ***DAYS-OF-ELIGIBILITY*** > **0** and ***SCHIP-CODE*** = **1** or **2**

  1 – Yes

  2 – No

- Days Enrolled with Full Benefits by month and entire reference year

January	→	***ELIG_DAYS_FULL_1***
February	→	***ELIG_DAYS_FULL_2***
…		…
December	→	***ELIG_DAYS_FULL_12***
January (of subsequent year)	→	***FBDE13***
February (of subsequent year)	→	***FBDE14***
March (of subsequent year)	→	***FBDE15***
April (of subsequent year)	→	***FBDE16***
Entire reference year	→	***TOT_DAYS_ANY***

  For each month if ***RESTRICTED-BENEFITS-FLAG*** = **1** or **4** and ***SCHIP-CODE*** = **1** <u>minimum of</u> ***DAYS-OF-ELIGIBILITY*** and *days-in-calendar-month;* otherwise **0 .** For reference year, sum of values for combining months.

- Days Enrolled with Any Benefits by month and entire reference year

January	→	***ELIG_DAYS_ANY_1***
February	→	***ELIG_DAYS_ANY_2***
…		…
December	→	***ELIG_DAYS_ANY_12***
January (of subsequent year)	→	***ABDE13***
February (of subsequent year)	→	***ABDE14***
March (of subsequent year)	→	***ABDE15***
April (of subsequent year)	→	***ABDE16***
Entire reference year	→	***TOT_DAYS_ANY***

  For each month (and corresponding variable), if ***RESTRICTED-BENEFITS-FLAG*** = **1** or **4** and ***SCHIP-CODE*** = **1**, <u>minimum of</u> ***DAYS-OF-ELIGIBILITY*** and *days-in-calendar-month;* otherwise **0 .**

- Benefit Type (***BEN_TYPE***)

  Hierarchy (Use the highest, that is nearest to **1**, code ever seen for that ***MSIS-IDENTIFICATION-NUMBER*** during CY 2000):

  1 – Full Benefits (***DAYS-OF-ELIGIBILITY*** > **0** and ***RESTRICTED-BENEFITS FLAG*** = **1** or 4 and ***SCHIP-CODE*** = **1**)

  2 – Partial Benefits (***DAYS-OF-ELIGIBILITY*** > **0** and ***SCHIP-CODE*** = **1**)

  3 – SCHIP (Medicaid-expansion) (Days-of-Eligibility > **0** and ***SCHIP-CODE*** = **2**)

  4 – SCHIP (stand-alone) (***SCHIP-CODE*** = **3**)

  5 – All Else

- SSI-Cash (***SSI_CASH***)
  For any month, ***MAINTENANCE-ASSISTANCE-STATUS*** = **1** and ***BASIS-OF-ELIGIBILITY*** = **1** or **2**
  1 – Yes
  2 – No
- Race (***M_RACE***)
  From ***RACE-ETHNICITY-CODE***
  1 → **-W-** White
  2 → **-B-** Black
  3 → **-I-** American Indian or Alaskan Native
  4 → **-A-** Asian or Pacific Islander
  6 → **-A-** Asian or Pacific Islander
  - → **-*-** More than one code for SSN: characterized as "Race Unknown"
- Ethnicity (***M_HISP***)
  From ***RACE-ETHNICITY-CODE*** *is ever* **5** or **7** then ***M_HISP*** → **-Y-** (Yes, Hispanic).
  Otherwise, ***M_HISP*** → *space-filled*: in this case, person is characterized as "*Ethnicity Unknown*".

CPS Coding:

We coded the following CPS variables so we would have CPS information in a form appropriate for our analyses:

- CPS Health Insurance Category (***CPS_HI***) Hierarchy:

If ***CAID*** = **1** or ***OTHSTYP1*** = **02** or ***OTHSTYP2*** = **02** or ***OTHSTYP3*** = **02** or ***OTHSTYP4*** = **02** or ***OTHSTYP5*** = **02** or ***OTHSTYP6*** = **02** or ***AHITYP1*** = **02** or ***AHITYP2*** = **02** or ***AHITYP3*** = **02** or ***AHITYP4*** = **02** or ***AHITYP5*** = **02** or ***AHITYP6*** = **02** then

If ***MCARE*** = 1 or ***CHAMP*** = **1** or ***COV_HI*** = **1** or ***OTYP_***{1 - 6} or ***ATYP_***{1 - 6} = **1** or **3 - 15**
CPS_HI ← **1** (*Medicaid Only*)

Otherwise
CPS_HI ← **2** (*Medicaid with Other Insurance*)

Otherwise if (***MCAID*** = **1** or ***MCARE*** = **1**) and ***CHAMP*** = **2** and ***COV_HI*** = **2**
CPS_HI ← **3** (*Other Public Only*)

Otherwise if (***COV_HI*** = **1** or ***CHAMP*** = **1**) and ***MCAID*** = **2** and ***MCARE*** = **2**
CPS_HI ← **4** (*Other Private Only*)

Otherwise if (***MCAID*** = **1** or ***MCARE*** = **1**) and (***COV_HI*** = **1** or ***CHAMP*** = **1**)
CPS_HI ← **5** (*Other Public and Private*)

Otherwise if ***CHAMP*** = **2** and ***MCAID*** = **2** and ***MCARE*** = **2** and ***COV_HI*** = **2**
CPS_HI ← **6** (*Uninsured*)

- CPS (Health Insurance) Data Source (***CPS_DS***) Hierarchy:
  If *FL_665* = **2** or **3** or *I_CAID* = **1** or *I_OTH* = **1** or *IAHITYP* = **1**
  CPS_DS ← **I** (*Imputed*)

  Otherwise if *I_CAID* = **2**
  CPS_DS ← **E** (*Edited*)

  Otherwise
  CPS_DS ← **R** (*Reported*)

- CPS TANF Enrollment Status (**CPS_TANF**)
  If *FINC_PAW* = **1**
  CPS_TANF ←**Y**

  Otherwise
  CPS_TANF ←**N**

- CPS SSI Enrollment Status (***CPS_SSI***)

  If *SSI_YN* = **1** then *CPS_SSI* = **Y**
  CPS_SSI ← **Y**

  Otherwise
  CPS_SSI ← **N**

Determining Out-of-Scope Persons:

CPS considers persons living in institutional group quarters (those group quarters that are formally authorized to provide supervised care or custody to residents, such as correctional institutions, nursing homes and juvenile institutions, etc. out-of scope. To make MSIS record counts in Table 2 more comparable to CPS estimates, a decision was made that certain MSIS represented persons were likely to have been residents of institutional group quarters during the reference year. This determination was made by reference to that year's version of the Census Master Address File-Auxiliary Reference File (MAF-ARF). MAF-ARF shows, by person, all MAF-identified addresses within the Census collection of administrative records. The MAF-ARF is indexed by PIK (which is an identity-protected re-coding of SSN). For each identified MSIS person (those with a validated SSN), all MAF-ARF records indexed by that PIK were reviewed to see which are institutional group quarters. MAF records with MAF variable ***GQTYPE*** in these ranges were noted as institutional group quarters:

101	≤	***GQTYPE***	≤	107
201	≤	***GQTYPE***	≤	209
301	≤	***GQTYPE***	≤	307
400	≤	***GQTYPE***	≤	410

Based on this review, for each person in MAF-ARF (represented by a unique PIK) an institutional group quarters flag (***IGQ_FLAG***) was set as follows:

- *Some* MAF-ARF addresses for this PIK are institutional group quarters: ***IGQ_FLAG*** ← **B**
- *All* MAF-ARF addresses for this PIK are institutional group quarters: ***IGQ_FLAG*** ← **Y**
- *No* MAF-ARF addresses for this PIK are institutional group quarters or no MAF-ARF addresses were found for this person: ***IGQ_FLAG*** ← *blank*.

The value of the ***IGQ_FLAG*** is used in Table 2 to subset (for Columns 4, 5, and 6) MSIS records to be counted (see Table 2 discussions, below). Other than its use here in Table 2, ***IGQ_FLAG*** is not referenced in the production of Phase II tables.

Characterizing Joint Demographics (Age, Race, Sex, Ethnicity):

For tabulation after linkage of MSIS to CPS:

1. If the person is on CPS (whether or not they are seen on MSIS), characteristics come from CPS: ***PUBIRTHY***, ***A_RACE***, ***A_SEX***, ***A_ORIGIN***.
2. Otherwise if we determined the person's identity (that is, the SSN has been validated), characteristics come from Person Characteristic File (PCF)
3. Otherwise (for MSIS records without a validated SSN), characteristics come from MSIS.

Age is determined as {*Reference Year*} – {*Year- of-Birth*}, which is the age as of December 31 of the reference year. Age categorization directly follows, with these exceptions:

- If age comes from CPS and ***PUBIRTHY*** is not between 1880 and {*Reference Year*}, inclusively, then age category is set to *Unknown*.
- Otherwise if age is computed to be less than 0 then age category is set to *Unknown*.

If Race and Ethnicity come from PCF, then these values come either directly from Census 2000, Hundred Percent Detail File, ***IMPUTED-RACE*** and ***HISPANIC-ORIGIN-CODE*** – if the Census 2000 record for this person can be found; otherwise it comes from a race and ethnicity model that is used to impute these values.

Generating Tables for the Phase II Report:

Note that for each table included in the Phase II report there are two presentations:

- Using original CPS weights.
- Using adjusted weights coming from a re-weighting process. Weight on un-identifiable CPS records (that is, records for which the SSN is unknown or un-validated) is shifted on to identifiable CPS records in a way that attempts to preserve the percentage of distributions of the various characteristics (particularly ***CPS_HI)***.

Table 1:

Basis of Counting:

- MSIS: Unduplicated (by MSIS ID) MSIS file: All records.
- CPS: 2001 (linked to MSIS for calendar year 2000) uses expanded sample, 2002 (linked to MSIS for calendar year 2001) uses full sample:
  - For original weight presentation, weighting is by ***MARSUPWT***.
  - For re-weighted presentation, weighting is by ***ADJWGT*** (developed in the re-weighting process).

Columns:

Column 1 (CPS Not Valid SSN), Column 2 (CPS Valid SSN Not Matched), Column 3 (CPS Refused to Provide SSN) and Column 6 (Valid SSN and Matched) together include all CPS records being used for linkage. Each CPS record is tallied under one and only one column. If a CPS record has a validated SSN value, and that value also occurs (and is validated) in the MSIS file, that record is tallied under column 6. Otherwise, if ***PUSSN_FLG*** = **R** (indicating refusal to provide SSN) then a record is tallied under column 3. Otherwise if the SSN value has been validated, the record is tallied under column 2 and if not under column 1. For each of these columns (1, 2, 3, 6), when a weighted presentation is being made, it is the weights themselves that are being tallied: either ***MARSUPWT*** or ***ADJWGT***.

Column 4 (MSIS Not Valid SSN), Column 5 (MSIS Valid SSN) together with Column 6 (Valid SSN and Matched) together tabulate all MSIS records, with each MSIS record falling under one and only one column. This is a count of MSIS records (for the reference calendar year, only) after person un-duplication. For this reason, persons (that we know are) represented as more than one client are counted only once, not once for each client account. Since MSIS records are self-representing, each can be considered to have a weight of (1); however, for weighted presentations, each record counted under Column 6 are weighted by the appropriate (original or adjusted) CPS weight of the matching CPS record.

Column 7 (%CPS Persons Matched) is Column 6 / (Column 2 + Column 6), and Column 8 (%MSIS Persons Matched) is Column 6 / (Column 5 + Column 6).

Rows:

- Age is determined as described above (in the Characterizing Joint Demographics section); age range follows directly.
- Race is determined as described above. Because "*Unknown Race*" occurs only in MSIS, only MSIS records with SSN value unverified can have this code.
- Sex is determined as described above.
- Poverty Level is determined directly from CPS variable ***POVLL***. For this reason, it is only available for records that have CPS as a source.

- CPS Insurance Type is determined directly from ***CPS_HI*** (see description of the generation of this variable in MSIS summarization discussion above). For this reason, it is only available for records that have CPS as a source.
- MSIS Insurance Type is determined directly from ***BEN_TYPE*** (see description of the generation of this variable in MSIS summarization discussion above).

Table 2:

Table 2 represents a set of counts from MSIS and a set of counts from CPS presented side-by-side. For MSIS counts, persons with a date-of-death on the Person Characteristics File (PCF) prior to March of corresponding survey year are excluded from tabulation. The joint occurrence of records from both files representing the same persons is not relevant to the production of this table. Columns 1 to 6 (MSIS Total A – MSIS Total F) are counts directly from the summarized (person-unduplicated) MSIS. Columns 7 to 9 (CPS Total A – CPS Total C) are (weighted) counts directly from CPS. Note that since CPS asks respondents about health insurance status for the year previous (termed the reference year), the CPS survey year version is one year ahead of the MSIS summarized data shown on the same page.

Columns:

Column 1 (MSIS Total A) counts MSIS client accounts persons known to be deceased prior to March of the corresponding survey year. Moving to the right, each subsequent column counts a subset of the client accounts counted in the column immediately to the left. The exclusions are made as follows:

- Column 1 (MSIS Total A): Excludes only persons with a date-of-death on PCF prior to March of survey year; represents a count of unique client account (which is the same as unique State/MSIS-Identification-Number).
- Column 2 (MSIS Total B): Excludes clients where ***BEN_TYPE*** ≠ **1** or **2**.
- Column 3 (MSIS Total C): Excludes clients where ***BEN_TYPE*** ≠ **1**.
- Column 4 (MSIS Total D): Excludes clients where ***BEN_TYPE*** ≠ **1** or ***IGQ_FLAG*** ≠ ‘ ’.
- Column 5 (MSIS Total E): Excludes clients where ***BEN_TYPE*** ≠ **1** or ***IGQ_FLAG*** ≠ ‘ ’ and duplicate clients (sharing the same SSN as other clients). So it is a count of unique persons (excepting unidentifiable duplicate client accounts, because they do not share the same verified SSN value, for the same person) with ***BEN_TYPE*** ≠ **1** or ***IGQ_FLAG*** ≠ ‘ ’.
- Column 6 (MSIS Total F): Excludes clients where ***BEN_TYPE*** ≠ **1** or ***IGQ_FLAG*** ≠ ‘ ’ and duplicative clients (sharing the same SSN with other clients) and clients with non-verified SSNs. So it is a count of unique identified persons (that is persons for whom we have a record with verified SSN value) with ***BEN_TYPE*** = **1**.

Columns 7 – 9 (CPS Total A – CPS Total C) are weighted counts of CPS person records. The weight used for the original weight presentations is ***MARSUPWT***. For re-weighted presentations, the weight is ***ADJWGT***, a weight created in the re-weighting process.

- Column 7 (CPS Total A): This is the weighted sum of ***MCAID***, which should closely match (re-weighting may cause a slight discrepancy) the CPS estimate of Medicaid enrollment.
- Column 8 (CPS Total B): This is the weighted sum of ***AUGMENTED-CAID***. ***AUGMENTED-CAID*** is set (equal to **1** – showing Medicaid enrollment in previous calendar year) whenever ***CAID*** is set (to show Medicaid enrollment). In addition it is set if the reportee is described explicitly as a Medicaid enrollee in response to a question about other types of health insurance or in response to a verification question asked about reportees who were not shown having any insurance earlier in the question sequence about their health coverage. In terms of coding from CPS variables:

  AUGMENTED-CAID ← **1** *if* ***CAID*** = **1** or ***OTHSTYP1*** = **02** or ***OTHSTYP2*** = **02** or ***OTHSTYP3*** = **02** or ***OTHSTYP4*** = **02** or ***OTHSTYP5*** = **02** or ***OTHSTYP6*** = **02** or ***AHITYP1*** = **02** or ***AHITYP2*** = **02** or ***AHITYP3*** = **02** or ***AHITYP4*** = **02** or ***AHITYP5*** = **02** or ***AHITYP6*** = **02** otherwise ***AUGMENTED-CAID*** ← **0**
- Column 9 (CPS Total C): This is the weighted sum of ***AUGMENTED-CAID*** (described immediately above) that includes only CPS records with ***CPS_DS*** **= R.**

Rows:

- Age is determined as described above; age range follows directly.
- Race is determined as described above. Because "Unknown Race" occurs only in MSIS, only MSIS records with SSN value unverified can have this code.
- Sex is determined as described above.
- Ethnicity is determined as described above.

Table 3:

Table 3 is a tabulation of CPS individual respondent records that have been linked (by Protected Identity Key, which substitutes SSN) to summarized MSIS person records that show actual Medicaid enrollment: ***TOT_DAYS_ANY*** > 0. Table 3 is organized into eight versions:

Version **Page #**

Enrollees With Full Benefits:

A. Full Benefit Enrollees .....1 - 3
B. Full Benefit Enrollees Whose CPS Insurance Status Was Edited .....4 - 6
C. Full Benefit Enrollees Whose CPS Insurance Status Was Imputed .....7 - 9
D. Full Benefit Enrollees Whose CPS Insurance Status Was Reported.....10 - 12

Enrollees With Any Benefits:

E. All Enrollees ..... 13 – 15
F. All Enrollees Whose CPS Insurance Status Was Edited .....16 - 18
G. All Enrollees Whose CPS Insurance Status Was Imputed .....19 - 21
H. All Enrollees Whose CPS Insurance Status Was Reported.....22 - 24

Note that the first four versions (A – D) tabulate CPS respondent records showing at least one day of Medicaid enrollment with full benefits (***TOT_DAYS_FULL*** > 0). Version A is a tabulation of all such qualifying records. Version B is a tabulation of qualifying records that have CPS Medicaid enrollment status edited (***CPS_DS*** = **E**). Version C is a tabulation of records that have enrollment status imputed (***CPS_DS*** = **I**). Version D is a tabulation of records that have enrollment status reported explicitly (***CPS_DS*** = **R**).

The second four versions (E – H) are identical to the first four except, rather that including only CPS records linked to an MSIS record showing full benefits, it includes all CPS records showing any type of Medicaid enrollment (that is having ***TOT_DAYS_ANY*** > 0). Version E is a tabulation of all such qualifying records. Version F is a tabulation of qualifying records that have CPS Medicaid enrollment status edited (***CPS_DS*** = **E**). Version G is a tabulation of records that have enrollment status imputed (***CPS_DS*** = **I**). Version H is a tabulation of records that have enrollment status reported explicitly (***CPS_DS*** = **R**).

Columns:

Columns 1 – 6 tabulate CPS records by ***CPS_HI,*** so that…

Data column 1:	***CPS_HI*** = **1**
Data column 2:	***CPS_HI*** = **2**
…	…

Column 7 totals Columns 1 – 6. Each data column also has a parenthetical percentage value that is that cells main tabulation value into the Column 7 row total.

Rows:

Age category, race, sex, and ethnicity are determined identically to Tables 1 and 2.
CPS SSI recipiency status and CPS TANF recipiency status are determined by ***CPS_SSI*** and ***CPS_TANF*** (as described in CPS Coding discussion). MSIS SSI recipiency status is determined by ***SSI_CASH*** (as described in the MSIS Summarization discussion). Medicaid benefit type is

determined by ***BEN_TYPE*** (**1** - 'Full Benefits', **2** - 'Partial not CHIP', **3** - 'Medicaid-expansion CHIP', see MSIS Coding discussion). Poverty level comes directly from the CPS variable ***POVLL***.

"Relationship to Respondent" is determined by the CPS variable ***A_RRP***. Note that the category **5** is split into "Non-Adult Children" (age 17 or less on December 31 of reference year, see Joint Demographic Characterization discussion on age determination above) and "Adult Children" (age 18 or greater on December 31 of reference year see Joint Demographic Characterization on age determination above).

MAX Managed-Care/Medical-Service Received (or Noted) is determined as follows:

Managed care enrollment is determined by review of the MAX fields ***MEDICAID-MANAGED-CARE-COMBINATION*** (separate fields exist for each month of reference year):

If ***MANAGED-CARE-COMBINATION*** ***ever*** has value ≠ ' ' (space-filled), **00**, **99** *or* **16** then represented person is said to have had ***some*** managed care coverage during reference year.

Received service is determined by review of the MAX field ***RECIPIENT-INDICATOR***:

If **RECIPIENT-INDICATOR** *≠ 0 or 2 then the represented person is said to have had received a medical service during the reference year. According to Centers for Medicare and Medicaid Services (CMS), managed care encounters are often not reported to CMS. For this reason, if MAX shows that a represented person had* ***some*** *managed care coverage, but shows* ***no*** *medical service reported,* ***it may be the case*** *that this person* ***did*** *have a managed care encounter that is* ***not noted****. However, if a represented person had* ***only fee-for-service coverage****, then if no medical service* ***is reported****, this person* ***most likely*** *did not receive* ***any*** *medical services in the reference year.*

In some cases, we cannot locate a MAX record for a person represented in MSIS. In this case, tabulations are made to the row "No MAX data available."

Table 4:

Table 4 is a tabulation of CPS individual respondent records for persons for whom Medicaid enrollment cannot be established. In most cases, the CPS records for these persons will have no corresponding MSIS record (that is, an MSIS record for the same PIK or same SSN). In some cases, there may be a corresponding MSIS record, but this record does not show that person having received Medicaid benefits in the reference year. This may occur if the person is enrolled in a stand-alone SCHIP or there is some other quirk in the way states provide their person data to CMS. Table 3 and Table 4 are complementary: all CPS records are tabulated in one or the other, but none are tabulated in both.

Table 4 is presented in eight versions. The first four versions (A – D) tabulate unmatchable CPS records (because the respondent refused to provide the SSN, ***PUSSN_FLG*** = **R**, or the provided SSN could not be validated by Census). The second four versions (E – H) tabulate matchable CPS

records (because a validated SSN resides on the record). Because the re-weighting process shifts the entire weight on un-matchable records to matchable records, in re-weighted presentations, Versions A, B, C, and D are suppressed; otherwise all cells for these versions would be filled with zero values. As with Table 3, in each set of four versions, all qualifying records are tabulated in the first version (A or E) and in one and only one of the remaining three based on the value of ***CPS_DS***. So, Table 4 is organized as:

Version		Original Wgt. Presentation Page #	Reweighted Presentation Page #
Unmatchable Respondents:			
A.	All Unmatchable Respondents	1 – 2	N/A
B.	Whose CPS Insurance Status Was Edited	3 – 4	N/A
C.	Whose CPS Insurance Status Was Imputed	5 – 6	N/A
D.	CPS Insurance Status Was Reported	7 – 8	N/A
Matchable CPS Respondents not Known Receiving Medicaid:			
E.	All Respondents Not Known Receiving Medicaid	9 – 10	1 – 2
F.	Whose CPS Insurance Status Was Edited	11 – 12	3 – 4
G.	Whose CPS Insurance Status Was Imputed	13 – 14	5 – 6
H.	Whose CPS Insurance Status Was Reported	15 – 16	7 – 8

For Table 4, rows and columns tabulations are determined identically to Table 3, except, certain rows that for Table 3 are tabulated based on values in corresponding MSIS records are suppressed, as the tabulations in them would be essentially meaningless, otherwise.

For Internal Use Only

1. All CPS Estimates are of weighted totals.
2. MSIS Total A is total enrolled in MSIS.
3. MSIS Total B is total MSIS without SCHIP.
4. MSIS Total C is total enrolled for full benefits.
5. MSIS Total D is total enrolled for full benefits, excluding residents of institutional-GQs.
6. MSIS Total E is total enrolled for full benefits, excluding residents of institutional-GQs and duplicative client accounts.
7. MSIS Total F is Total E excluding un-indentified clients: those having records with un-validated SSNs.
8. CPS Total A uses MCAID.
9. CPS Total B uses Augmented-CAID.
10. CPS Total C uses explicitly reported in Medicaid: Augmented-CAID (excluding imputed or edited responses).

For Internal Use Only

1. All CPS Estimates are of weighted totals.
2. MSIS Total A is total enrolled in MSIS.
3. MSIS Total B is total MSIS without SCHIP.
4. MSIS Total C is total enrolled for full benefits.
5. MSIS Total D is total enrolled for full benefits, excluding residents of institutional-GQs.
6. MSIS Total E is total enrolled for full benefits, excluding residents of institutional-GQs and duplicative client accounts.
7. MSIS Total F is Total E excluding un-indentified clients: those having records with un-validated SSNs.
8. CPS Total A uses MCAID.
9. CPS Total B uses Augmented-CAID.
10. CPS Total C uses explicitly reported in Medicaid: Augmented-CAID (excluding imputed or edited responses).

For Internal Use Only

1. All CPS Estimates are of weighted totals.
2. MSIS Total A is total enrolled in MSIS.
3. MSIS Total B is total MSIS without SCHIP.
4. MSIS Total C is total enrolled for full benefits.
5. MSIS Total D is total enrolled for full benefits, excluding residents of institutional-GQs.
6. MSIS Total E is total enrolled for full benefits, excluding residents of institutional-GQs and duplicative client accounts.
7. MSIS Total F is Total E excluding un-indentified clients: those having records with un-validated SSNs.
8. CPS Total A uses MCAID.
9. CPS Total B uses Augmented-CAID.
10. CPS Total C uses explicitly reported in Medicaid: Augmented-CAID (excluding imputed or edited responses).

For Internal Use Only

1. All CPS Estimates are of weighted totals.
2. MSIS Total A is total enrolled in MSIS.
3. MSIS Total B is total MSIS without SCHIP.
4. MSIS Total C is total enrolled for full benefits.
5. MSIS Total D is total enrolled for full benefits, excluding residents of institutional-GQs.
6. MSIS Total E is total enrolled for full benefits, excluding residents of institutional-GQs and duplicative client accounts.
7. MSIS Total F is Total E excluding un-indentified clients: those having records with un-validated SSNs.
8. CPS Total A uses MCAID.
9. CPS Total B uses Augmented-CAID.
10. CPS Total C uses explicitly reported in Medicaid: Augmented-CAID (excluding imputed or edited responses).
